1 Introduction to Spectral Geometry

2 Detailed introduction to abstract spectral theory
   2.1 Linear operators
       2.1.1 Bounded operators
       2.1.2 Lax–Milgram theorem
       2.1.3 Unbounded operators
   2.2 Closed operators
   2.3 Adjoint operators
       2.3.1 Introduction
       2.3.2 Symmetry and self-adjointness
       2.3.3 An important result concerning self-adjoint operators
   2.4 Spectrums and resolvent set
       2.4.1 Spectrum versus point spectrum
       2.4.2 The self-adjoint case
   2.5 Spectral theory of compact operators
       2.5.1 The notion of compact operators
       2.5.2 Algebraic properties of compact operators
       2.5.3 Main spectral theorem for compact self-adjoint operators
       2.5.4 A proof using the Riesz–Schauder theory
   2.6 The spectral theorem multiplication operator form for unbounded operators on a Hilbert space
       2.6.1 Spectral theorem multiplication operator form
       2.6.2 Functional calculus
       2.6.3 Functional calculus in Quantum Mechanics
   2.7 Some complements on operators theory
       2.7.1 Closable operators
       2.7.2 Unbounded operators with compact resolvents
       2.7.3 Numerical range and applications
   2.8 Exercises

3 The Laplacian on a compact Riemannian manifold
   3.1 Basic Riemannian Geometry
       3.1.1 Differential Geometry: conventions and notations
       3.1.2 Riemannian manifolds and examples
       3.1.3 Metric structure and geodesics on a Riemannian manifold
       3.1.4 Curvatures on a Riemannian manifold
       3.1.5 Integration on a Riemannian manifold

## Contents

3.2 Analysis on manifolds ........................................... 66  
3.2.1 Distributions on a Riemannian manifold ............... 66  
3.2.2 Sobolev spaces on a Riemannian manifold .......... 67  
3.2.3 The Laplacian operator and the Green formula ...... 68  
3.3 Exercises .......................................................... 69  

4 Spectrum of the Laplacian on a compact manifold .............. 71  
4.1 Physical examples ............................................... 71  
4.1.1 The wave equation on a string ......................... 71  
4.1.2 The heat equation ......................................... 72  
4.1.3 The Schrödinger equation ................................ 73  
4.2 A class of spectral problems ................................... 75  
4.2.1 The closed eigenvalue problem ......................... 75  
4.2.2 The Dirichlet eigenvalue problem ................. 75  
4.2.3 The Neumann eigenvalue problem ............... 76  
4.2.4 Other problems ........................................... 76  
4.3 Spectral theorem for the Laplacian ......................... 76  
4.4 A detailed proof by a variational approach ............... 78  
4.4.1 Variational generic abstract eigenvalue problem ...... 78  
4.4.2 The closed eigenvalue problem ......................... 81  
4.4.3 The Dirichlet eigenvalue problem ................. 84  
4.4.4 The Neumann eigenvalue problem ............... 87  
4.4.5 A remark on the variational formulation .......... 89  
4.5 The minimax principle and applications ................... 90  
4.5.1 A physical example ....................................... 90  
4.5.2 The minimax theorem ................................... 91  
4.5.3 Properties of the first eigenvalue ..................... 95  
4.5.4 Monotonicity domain principle ....................... 97  
4.5.5 A perturbation of metric result ........................ 98  
4.6 Complements: The Schrödinger operator and the Hodge–de Rham Laplacian ........................................... 100  
4.6.1 The Schrödinger operator ................................. 100  
4.6.2 The Hodge–de Rham Laplacian ......................... 102  

5 Direct problems in spectral geometry ........................... 107  
5.1 Explicit calculation of the spectrum ....................... 107  
5.1.1 Flat tori ................................................. 107  
5.1.2 Rectangular domains with boundary conditions ...... 109  
5.1.3 Spheres ................................................... 109  
5.1.4 Harmonic oscillator ...................................... 110  
5.2 Qualitative properties of the spectrum .................... 113  
5.2.1 From the bottom of the spectrum ...................... 113  
5.2.2 . . . to the large eigenvalues: the Weyl formula .... 117
