Discrete Differential Geometry

Organised by
Alexander I. Bobenko, Berlin
Richard Kenyon, Providence
Peter Schröder, Pasadena
Günter M. Ziegler, Berlin

July 8th– July 14th, 2012

ABSTRACT. This is the collection of extended abstracts for the 24 lectures and the open problems session at the third Oberwolfach workshop on Discrete Differential Geometry.

Mathematics Subject Classification (2010): 52-xx, 53-xx, 57-xx.

Introduction by the Organisers

Discrete Differential Geometry is a very productive research area where graph theory, analysis, integrability, and geometry interact and contribute to the construction and understanding of discrete models for differential geometric situations and structures. It also plays a very important role in applications, to graphics and simulations of PDE.

This was the third Discrete Differential Geometry conference at Oberwolfach. The subject has evolved significantly since its beginning a decade ago. This year's conference highlighted advances in new areas: in discrete exterior calculus and cluster algebras in geometry, as well as in some older ones: discrete uniformization, polyhedra, applications to PDE.

The workshop featured many talks around the subject of discrete exterior calculus. The main idea of discrete exterior calculus is to find the right adaptation of the classical notions of forms, exterior differentiation, Hodge decomposition, etc. to functions on cell complexes, with the goal being to do classical analysis using discrete approximations to continuous objects. The talks by Chelkak, von Deylen, Günther, Hildebrandt, Skopenkov, Stern all fit in this category. From the variety

of techniques presented we can only say that the subject is still under discussion, and that a global framework is still to be found.

Another new and exciting direction is the integrability and cluster structure of discrete geometric mappings. Here we heard talks by Doliwa, Goncharov, Suris, Tabachnikov on connections between various discrete systems and cluster algebras/varieties or other integrable structures. This area seems ripe for further exploration, in particular since we don't understand what features these models have in common, and what consequences the cluster structure may have. In particular the cluster structure allows one to introduce quantization which may yield important new avenues of research.

There were a few talks about polyhedra (by Adiprasito, Izmistiev, Schlenker) and versions of discrete uniformization (by Sechelmann, Stephenson, Sullivan). Although these are more well-studied areas the new ideas presented open new opportunities for further research.

Finally there were a few talks about discretizations of PDE: by Crane, Lessig, Schief, Schumacher, Hoffmann, Vouga. Here we include applications to graphics: mapping textures to surfaces and smoothing using conformal maps is one common theme. This area of PDE applications continues to be an important source of inspiration for theoretical advances in discrete differential geometry: our goal is to be able to model PDEs, and often finding the right discretization makes a huge difference in efficiency. Furthermore some systems have discretizations which are in some sense more natural than their continuous counterparts (in the sense that there is more mathematical structure).

The organizers are grateful to all participants for all the lectures, discussions, and conversations that combined into this very lively and successful workshop – and to everyone at Research Institute in Oberwolfach for the perfect setting.

Workshop: Discrete Differential Geometry

Table of Contents

Karim A. Adiprasito (joint with Günter M. Ziegler)	
<i>Many 4-polytopes with a low-dimensional realization space</i>	2081
Dmitry Chelkak	
<i>Discrete complex analysis: conformal invariants without conformal invariance</i>	2083
Keenan Crane (joint with Clarisse Weischedel and Max Wardetzky)	
<i>Fast Computation of Geodesic Distance via Linear Elliptic Equations</i> ..	2086
Stefan W. von Deylen	
<i>Axioms for an Arbitrary (Discrete) Calculus with Dirichlet Problem and Hodge Decomposition</i>	2087
Adam Doliwa	
<i>Hirota equation and the quantum plane</i>	2089
Felix Günther (joint with Alexander I. Bobenko)	
<i>Discrete complex analysis on quad-graphs</i>	2091
Klaus Hildebrandt (joint with Konrad Polthier)	
<i>Consistent discretizations of the Laplace–Beltrami operator and the Willmore energy of surfaces</i>	2094
Wolfgang K. Schief and Tim Hoffmann	
<i>Discrete focal surfaces and geodesics</i>	2097
Ivan Izmistiev	
<i>Flexible Kokotsakis polyhedra and elliptic functions</i>	2099
Christian Lessig	
<i>The Geometry of Light Transport Theory</i>	2100
Yaron Lipman	
<i>Discrete Quasiconformal Mappings of Triangular Meshes</i>	2103
Feng Luo	
<i>Simplicial $SL(2, \mathbf{R})$ Chern-Simons theory and Boltzmann entropy on triangulated 3-manifolds</i>	2103
Stefan Sechelmann (joint with Alexander I. Bobenko and Boris Springborn)	
<i>Uniformization of discrete Riemann surfaces</i>	2105
Jean-Marc Schlenker (joint with Jeffrey Danciger and Sara Maloni)	
<i>Geometric properties of anti-de Sitter simplices and applications</i>	2107

Henrik Schumacher (joint with Sebastian Scholtes and Max Wardetzky)	
<i>Convergence of Discrete Elastica</i>	2108
Mikhail Skopenkov	
<i>Discrete analytic functions: convergence results</i>	2110
Olga Sorkine (joint with Daniele Panozzo, Olga Diamanti, Ilya Baran)	
<i>Weighted Averages on Surfaces</i>	2111
Ken Stephenson (joint with James Ashe and Edward Crane)	
<i>Generalized Branching: Making Circles Behave</i>	2113
Ari Stern (joint with Paul Leopardi)	
<i>The abstract Hodge–Dirac operator and its stable discretization</i>	2116
John M. Sullivan	
<i>Lifting Spherical Cone Metrics</i>	2118
Yuri B. Suris (joint with Matteo Petrera)	
<i>Spherical geometry and integrable systems</i>	2122
Serge Tabachnikov	
<i>Higher pentagram maps, directed weighted networks, and cluster algebras</i>	2125
Etienne Vouga (joint with Mathias Höbinger, Johannes Wallner, Helmut Pottmann)	
<i>Design of Self-supporting Surfaces</i>	2127
Collected by Klaus Hildebrandt	
<i>Open problems in Discrete Differential Geometry</i>	2130
