Preface	vii
Introduction	1
I Mathematical Background	13
1 Quantum Mechanics and Stochastic Analysis	15
1.1 The Model and Preliminaries	15
1.1.1 The Model	15
1.1.2 Linear Operators in Hilbert Spaces	18
1.1.3 Quantum Oscillators	36
1.2 Local Gibbs States	62
1.2.1 Local Hamiltonians and Gibbs States	63
1.2.2 Von Neumann Algebras and Normal States	67
1.2.3 Høegh-Krohn's Theorem	72
1.2.4 Green and Matsubara Functions	78
1.2.5 Gibbs States of Noninteracting Harmonic Oscillators	87
1.3 Stochastic Analysis	93
1.3.1 Beginnings	93
1.3.2 Gaussian Processes	95
1.3.3 Stochastic Processes in General	100
1.3.4 Probability Measures on Polish Spaces	112
1.3.5 Probability Measures on Hilbert Spaces	118
1.3.6 Properties of the Høegh-Krohn Process	125
1.3.7 Harmonic Oscillators and the Høegh-Krohn Process	135
1.4 Local Gibbs States via Stochastic Analysis	137
1.4.1 Local Euclidean Gibbs States	138
1.4.2 Matsubara Functions for Unbounded Operators	143
1.4.3 Periodic Local Gibbs States	147
1.4.4 Analytic Properties of Local Gibbs States	148
1.5 Comments and Bibliographic Notes	150
2 Lattice Approximation and Applications	155
2.1 Lattice Approximation	155
2.2 Basic Correlation Inequalities	162
2.3 The Logarithmic Sobolev Inequality	168
2.4 The Lee–Yang Property	171
2.5 More Inequalities	174
2.5.1 The Vector Case: Scalar Domination	175
2.5.2 Zero Field Domination	179

2.5.3	Estimates of Moments and Correlation Functions	182
2.5.4	Estimates for Ursell Functions	185
2.6	Comments and Bibliographic Notes	188
3	Euclidean Gibbs Measures	191
3.1	Gibbs States	192
3.1.1	Thermodynamic Limit	192
3.1.2	Gibbs States	194
3.1.3	Configuration Spaces	195
3.1.4	Tempered Euclidean Gibbs Measures	200
3.2	Properties of Gibbs Specifications	208
3.2.1	Exponential Moment Estimates	208
3.2.2	Weak Convergence of Tempered Measures	212
3.3	Properties of Euclidean Gibbs Measures	214
3.4	Analytic Approach to Euclidean Gibbs Measures	222
3.4.1	Flow Description of Euclidean Gibbs Measures	222
3.4.2	Integration by Parts	226
3.5	The Case of Local Interactions	230
3.6	Periodic Euclidean Gibbs Measures	232
3.7	FKG order	238
3.8	Comments and Bibliographic Notes	243
II	Physical Applications	247
4	Anharmonic Crystal as a Physical Model	249
4.1	Modeling Physical Substances	249
4.2	The Classical Limit	252
4.3	The High-Temperature Uniqueness	255
4.4	Comments and Bibliographic Notes	259
5	Thermodynamic Pressure	262
5.1	The Existence of Thermodynamic Pressure	262
5.2	Dependence on the External Field	269
5.3	Uniqueness Criteria	275
5.4	Comments and Bibliographic Notes	277
6	Phase Transitions	280
6.1	Phase Transitions and Order Parameters	281
6.2	Reflection Positivity and Infrared Bound	291
6.2.1	Reflection positive functionals	291
6.2.2	Gaussian Domination	295
6.2.3	Infrared Bound	300
6.3	Examples of Phase Transitions	304

6.3.1	Phase Transitions in Rotation Invariant Models	304
6.3.2	Phase Transitions in Symmetric Scalar Models	309
6.3.3	Phase Transition in Asymmetric Scalar Models	311
6.4	Critical Point of a Hierarchical Model	314
6.4.1	The Model and the Main Result	315
6.4.2	Preliminary Statements	317
6.4.3	Proof of Theorem 6.4.1	321
6.4.4	Proof of Lemma 6.4.7	323
6.5	Comments and Bibliographic Notes	332
7	Quantum Effects	336
7.1	Quantum Stabilization	336
7.1.1	The Stability of Quantum Crystals	336
7.2	Decay of Correlations	340
7.2.1	The Main Statement	340
7.2.2	Decay of Correlations in Gibbs States	344
7.3	Suppression of Phase Transitions	346
7.3.1	The Uniqueness for Scalar Ferromagnets	346
7.3.2	Normality of Fluctuations in Vector Ferromagnets	349
7.4	Comments and Bibliographic Notes	352
	Bibliography	355
	List of Symbols	373
	Index	377
