Preface	v
1 Arithmetic and topology in the complex plane	1
1.1 Arithmetic of complex numbers	1
1.2 Analytic geometry with complex terminology	8
1.3 Topological notions. The compactified plane	12
1.4 Curves, paths, length elements	17
1.5 Branches of the argument. Index of a closed curve with respect to a point	22
1.6 Domains with regular boundary	28
1.7 Exercises	35
2 Functions of a complex variable	39
2.1 Real variable polynomials, complex variable polynomials, rational functions	39
2.2 Complex exponential functions, logarithms and powers. Trigonometric functions	41
2.3 Power series	46
2.4 Differentiation of functions of a complex variable	59
2.5 Analytic functions of a complex variable	69
2.6 Real analytic functions and their complex extension	76
2.7 Exercises	80
3 Holomorphic functions and differential forms	85
3.1 Complex line integrals	85
3.2 Line integrals, vector fields and differential 1-forms	88
3.3 The fundamental theorem of complex calculus	94
3.4 Green's formula	99
3.5 Cauchy's Theorem and applications	107
3.6 Classical theorems	111
3.7 Holomorphic functions as vector fields and harmonic functions	124
3.8 Exercises	131
4 Local properties of holomorphic functions	136
4.1 Cauchy integral formula	136
4.2 Analytic functions and holomorphic functions	140
4.3 Analyticity of harmonic functions. Fourier series	145

4.4	Zeros of analytic functions. Principle of analytic continuation . . .	148
4.5	Local behavior of a holomorphic function. The open mapping theorem	153
4.6	Maximum principle. Cauchy's inequalities. Liouville's theorem .	156
4.7	Exercises	159
5	Isolated singularities of holomorphic functions	164
5.1	Isolated singular points	164
5.2	Laurent series expansion	168
5.3	Residue of a function at an isolated singularity	174
5.4	Harmonic functions on an annulus	178
5.5	Holomorphic functions and singular functions at infinity	180
5.6	The argument principle	183
5.7	Dependence of the set of solutions of an equation with respect to parameters	188
5.8	Calculus of real integrals	190
5.9	Exercises	203
6	Homology and holomorphic functions	207
6.1	Homology of chains and simply connected domains	207
6.2	Homological versions of Green's formula and Cauchy's theorem .	211
6.3	The residue theorem and the argument principle in a homological version	219
6.4	Cauchy's theorem for locally exact differential forms	220
6.5	Characterizations of simply connected domains	223
6.6	The first homology group of a domain and de Rham's theorem. Homotopy	225
6.7	Harmonic functions on n -connected domains	229
6.8	Exercises	232
7	Harmonic functions	236
7.1	Problems of classical physics and harmonic functions	236
7.2	Harmonic functions on domains of \mathbb{R}^n	244
7.3	Newtonian and logarithmic potentials. Riesz' decomposition formulae	253
7.4	Maximum principle. Dirichlet and Neumann homogeneous problems	262
7.5	Green's function. The Poisson kernel	264
7.6	Plane domains: specific methods of complex variables. Dirichlet and Neumann problems in the unit disc	268
7.7	The Poisson equation in \mathbb{R}^n	279

7.8	The Poisson equation and the non-homogeneous Dirichlet and Neumann problems in a domain of \mathbb{R}^n	294
7.9	The solution of the Dirichlet and Neumann problems in the ball	302
7.10	Decomposition of vector fields	307
7.11	Dirichlet's problem and conformal transformations	314
7.12	Dirichlet's principle	318
7.13	Exercises	320
8	Conformal mapping	326
8.1	Conformal transformations	326
8.2	Conformal mappings	328
8.3	Homographic transformations	335
8.4	Automorphisms of simply connected domains	343
8.5	Dirichlet's problem and Neumann's problem in the half plane	347
8.6	Level curves	349
8.7	Elementary conformal transformations	353
8.8	Conformal mappings of polygons	360
8.9	Conformal mapping of doubly connected domains	368
8.10	Applications of conformal mapping	371
8.11	Exercises	379
9	The Riemann mapping theorem and Dirichlet's problem	383
9.1	Sequences of holomorphic or harmonic functions	383
9.2	Riemann's theorem	396
9.3	Green's function and conformal mapping	398
9.4	Solution of Dirichlet's problem in an arbitrary domain	403
9.5	Exercises	411
10	Runge's theorem and the Cauchy–Riemann equations	415
10.1	Runge's approximation theorems	415
10.2	Approximation of harmonic functions	423
10.3	Decomposition of meromorphic functions into simple elements	425
10.4	The non-homogeneous Cauchy–Riemann equations in the plane. The Cauchy integral	436
10.5	The non-homogeneous Cauchy–Riemann equations in an open set. Weighted kernels	441
10.6	The Dirichlet problem for the $\bar{\partial}$ operator	450
10.7	Exercises	455

11 Zeros of holomorphic functions	460
11.1 Infinite products	460
11.2 The Weierstrass factorization theorem	466
11.3 Interpolation by entire functions	473
11.4 Zeros of holomorphic functions and the Poisson equation	477
11.5 Jensen's formula	481
11.6 Growth of a holomorphic function and distribution of the zeros	484
11.7 Entire functions of finite order	487
11.8 Ideals of the algebra of holomorphic functions	494
11.9 Exercises	500
12 The complex Fourier transform	504
12.1 The complex extension of the Fourier transform. First Paley–Wiener theorem	504
12.2 The Poisson formula	509
12.3 Bandlimited functions. Second Paley–Wiener theorem	512
12.4 The Laplace transform	521
12.5 Applications of the Laplace transform	533
12.6 Dirichlet series	544
12.7 The Z-transform	546
12.8 Exercises	550
References	555
Symbols	557
Index	559
