Preface	v
1 Accessibility percolation in random fitness landscapes	1
<i>by Joachim Krug</i>	
1.1 Introduction	1
1.2 Accessibility percolation in sequence space	3
1.3 Accessibility percolation on trees	9
1.4 Correlated fitness landscapes	11
1.5 Paths with valley crossing	14
1.6 Summary and conclusions	16
References	19
2 Branching random walks in random environment	23
<i>by Wolfgang König</i>	
2.1 Introduction	23
2.2 Spatial branching random walks in random environment	24
2.3 Multitype branching random walk in random potential	30
2.4 The PAM on finite graphs	35
2.5 Higher moments of the numbers of particles	36
2.6 Further perspectives	39
References	40
3 Microbial populations under selection	43
<i>by Ellen Baake and Anton Wakolbinger</i>	
3.1 Introduction	43
3.2 Lenski's long-term evolution experiment	44
3.3 A host-parasite model with balancing selection and reinfection	54
References	65
4 The population genetics of the CRISPR-Cas system in bacteria	69
<i>by Rolf Backofen and Peter Pfaffelhuber</i>	
4.1 Introduction	69
4.2 Classification of CRISPR systems and components	71
4.3 The pattern of spacer arrays within CRISPR	76
4.4 Outlook	79
References	80

5	Evolution of altruistic defence traits in structured populations	85
	<i>by Martin Hutzenthaler and Dirk Metzler</i>	
5.1	Introduction	85
5.2	Asymptotic frequencies of altruistic defence traits	89
5.3	Fixation/extinction of the average altruist frequency	92
5.4	Convergence to a forest of trees of excursions	93
5.5	Differentiability of semigroups	100
	References	102
6	Stochastic processes and host-parasite coevolution:	
	Linking coevolutionary dynamics and DNA polymorphism data	107
	<i>by Wolfgang Stephan and Aurélien Tellier</i>	
6.1	Introduction	107
6.2	Intrinsic stochasticity	114
6.3	Extrinsic stochasticity	121
6.4	Conclusion	123
	References	123
7	Stochastic models for adaptive dynamics: Scaling limits and diversity	127
	<i>by Anton Bovier</i>	
7.1	Theories of evolution	127
7.2	The individual based model	129
7.3	Scaling limits	131
7.4	The polymorphic evolution sequence	136
7.5	In one step	140
7.6	Escape through a fitness well	143
	References	147
8	Genealogies and inference for populations with highly skewed	
	offspring distributions	151
	<i>by Matthias Birkner and Jochen Blath</i>	
8.1	Multiple merger coalescents in population genetics	151
8.2	Inference based on the site-frequency spectrum	158
8.3	Multiple loci, diploidy and Ξ -coalescents	166
8.4	Discussion: Are they really out there?	171
	References	173
9	Multiple-merger genealogies: Models, consequences, inference	179
	<i>by Fabian Freund</i>	
9.1	Multiple-merger coalescents	179
9.2	Modelling multiple mergers for variable population size	183
9.3	How much genetic information is contained in a subsample?	187

9.4	Model selection between n -coalescents	191
9.5	Partition blocks and minimal observable clades	196
	References	199
10	Diploid populations and their genealogies	203
	<i>by Anja Sturm</i>	
10.1	Introduction	203
10.2	Haploid models	204
10.3	Diploid models	208
10.4	Various examples of diploid population models	212
10.5	Discussion and further connections to the literature	215
	References	218
11	Probabilistic aspects of Λ-coalescents in equilibrium and in evolution	223
	<i>by Götz Kersting and Anton Wakolbinger</i>	
11.1	Introduction	223
11.2	Dust-free Λ -coalescents	225
11.3	Λ -coalescents with a dust component	231
11.4	An asymptotic expansion for Beta-coalescents	233
11.5	Evolving n -coalescents	236
11.6	Evolving Λ -coalescents	239
	References	243
12	Population genetic models of dormancy	247
	<i>by Jochen Blath and Noemi Kurt</i>	
12.1	Introduction	247
12.2	Seed banks with spontaneous switching	250
12.3	Simultaneous switching	258
12.4	Open problems and perspectives for future work	262
	References	263
13	From high to low volatility: Spatial Cannings with block resampling and spatial Fleming–Viot with seed-bank	267
	<i>by Andreas Greven and Frank den Hollander</i>	
13.1	Background	267
13.2	Two models	269
13.3	Equilibrium	278
13.4	Random environment	282
13.5	Extensions	285
13.6	Perspectives	286
	References	287

14 Ancestral lineages in spatial population models with local regulation . .	291
<i>by Matthias Birkner and Nina Gantert</i>	
14.1 Introduction	291
14.2 Random walk on the oriented percolation cluster	293
14.3 Ancestral lineages for logistic branching random walks	302
14.4 Discussion	307
References	308
15 The symbiotic branching model: Duality and interfaces	311
<i>by Jochen Blath and Marcel Ortgiese</i>	
15.1 Introduction	311
15.2 The discrete-space voter model	312
15.3 The symbiotic branching model	315
15.4 Self-duality in the symbiotic branching model	320
15.5 Moment duality in the symbiotic branching model	322
15.6 Interface duality in the symbiotic branching model	326
15.7 Entrance laws for annihilating Brownian motions	329
15.8 Outlook	332
References	333
16 Multitype branching models with state-dependent mutation and competition in the context of phylodynamic patterns	337
<i>by Anja Sturm and Anita Winter</i>	
16.1 Introduction	337
16.2 The individual-based branching model	340
16.3 Possible scaling regimes	343
16.4 The measure-valued model	346
16.5 The evolving phylogenies	348
16.6 A two-level model	354
References	360
17 Ancestral lines under recombination	365
<i>by Ellen Baake and Michael Baake</i>	
17.1 Introduction	365
17.2 Moran model with recombination	366
17.3 Ancestral recombination graph and deterministic limit	370
17.4 An explicit solution for single-crossover recombination	377
17.5 Recombination in discrete time	379
References	380

18 Towards more realistic models of genomes in populations:	
The Markov-modulated sequentially Markov coalescent	383
<i>by Julien Y. Dutheil</i>	
18.1 Modelling the evolution of genomes in populations	383
18.2 Heterogeneity of processes along the genome	395
18.3 Existing approaches to account for spatial heterogeneity	396
18.4 The integrative sequentially Markov coalescent	399
18.5 Conclusions	403
References	403
19 Diffusion limits of genealogies under various modes of selection	409
<i>by Martin Hutzenthaler and Peter Pfaffelhuber</i>	
19.1 Introduction	409
19.2 Tree-valued Fleming–Viot process with selection and mutation	411
19.3 Genealogies under low levels of selection	415
19.4 A result on stochastic averaging	419
19.5 The tree-valued Fleming–Viot process under fluctuating selection	423
References	425
20 Counting, grafting and evolving binary trees	427
<i>by Thomas Wiehe</i>	
20.1 Introduction	427
20.2 Counting trees	428
20.3 Properties of ranked trees	431
20.4 Induced subtrees	437
20.5 Recombination	440
20.6 Evolving trees	443
References	448
21 Algebraic measure trees: Statistics based on sample subtree shapes and sample subtree masses	451
<i>by Anita Winter</i>	
21.1 Introduction	451
21.2 Algebraic measure trees	453
21.3 The subspace of binary algebraic measure trees	457
21.4 (Sub-)triangulations of the circle	461
21.5 The α -Ford chain on m -labelled cladograms and its dual	463
21.6 The α -Ford tree in the limit as $N \rightarrow \infty$	465
21.7 The α -Ford chain in the diffusion limit	470
References	473
