

Contents

- Preface vii

- 1 Ordinary differential equations 1**
 - 1.1 Definitions and motivations 1
 - 1.2 Existence and uniqueness 3
 - 1.3 Separable equations 4
 - 1.4 First-order linear equations 6
 - 1.5 Bernoulli equations 8
 - 1.6 Extension of the solutions 10
 - 1.7 Second-order linear equations with constant coefficients 11
 - 1.8 Euler and Riccati equations 16
 - 1.9 Linear differential systems 18
 - 1.10 Linear homogeneous systems 20
 - 1.11 Homogeneous systems with constant coefficients 22
 - 1.12 Nonhomogeneous systems 24

- 2 Functional analysis 27**
 - 2.1 Vector spaces and norms 27
 - 2.2 Banach spaces 31
 - 2.3 Linear operators and dual spaces 34
 - 2.4 Hilbert spaces 37
 - 2.5 Orthogonal projections in a Hilbert space 41
 - 2.6 Separable spaces 46
 - 2.7 L^p spaces and distributions 50
 - 2.8 Fourier series 58
 - 2.9 Fixed points and discrete dynamical systems 62
 - 2.10 The Peano–Picard existence and uniqueness theorem 67

- 3 First-order partial differential equations 71**
 - 3.1 A physical model leading to transport equations 71
 - 3.2 More general linear equations 74
 - 3.3 Cauchy problems for a class of nonlinear equations 79
 - 3.4 Classical solutions of nonlinear conservation law equations 80
 - 3.5 Weak solutions of nonlinear conservation law equations 84
 - 3.6 Characteristics for the Hamilton–Jacobi–Bellman equation 92

4	Calculus of variations	97
4.1	Examples of functionals in the calculus of variations	97
4.2	The Fréchet and Gâteaux derivatives	100
4.3	Convex functionals	102
4.4	The Euler–Lagrange equation	106
4.5	Particular cases of the Euler–Lagrange equation	109
4.6	Extremals in the space of piecewise smooth functions	112
4.7	Sufficient conditions for local optimality	116
4.8	Constrained optimization	122
4.9	Higher order problems and systems	125
4.10	Hamiltonian mechanics and pointwise constraints	129
5	Linear control theory	131
5.1	Some illustrative examples	131
5.2	Geometric solutions of control problems: a railroad rocket car	135
5.3	The bang-bang principle for linear control problems	137
5.4	Linear problems with unrestricted control space	143
5.5	Optimal controls with time payoff for linear problems	149
5.6	The Pontryagin minimum principle for linear problems	151
5.7	Hamiltonians and the Pontryagin minimum principle	156
6	Nonlinear control problems	161
6.1	Three problems in optimal control	161
6.2	PMP for the Mayer problem with fixed horizon	164
6.3	PMP for the Bolza problem	171
6.4	Some examples and applications of the PMP	174
6.5	Current value PMP	179
6.6	PMP with free horizon	181
6.7	PMP with transversality conditions	184
6.8	Road on a mountain	191
6.9	The minimal fuel moon lander control problem	192
6.10	Optimal lockdown strategies for pandemic viruses	204
7	Dynamic programming	215
7.1	From the PMP to dynamic programming	215
7.2	The value function	216
7.3	The Hamilton–Jacobi–Bellman equation	220
7.4	Some applications of the dynamic programming method	225
7.5	Possible failures of the dynamic programming method	234
7.6	Linear quadratic regulators	236

8 Solved exercises	241
8.1 Ordinary differential equations	241
8.2 Functional analysis	257
8.3 First-order partial differential equations	274
8.4 Calculus of variations	278
8.5 Control theory	299
8.6 Dynamic programming	324
Appendix	335
A.1 The Lagrange multiplier method in \mathbb{R}^2	335
A.2 Power series expansion of some analytic functions	338
A.3 The Cayley–Hamilton theorem	339
A.4 Bibliographical notes	340
References	341
Index	343
