# Singularities of the Riemann Functions of Hyperbolic Mixed Problems in a Quarter-Space 

By<br>Seiichiro WaKabayashi*

## 1. Introduction

Singularities of Riemann functions of hyperbolic mixed problems with constant coefficients in a quarter-space have been investigated, for example, by Duff [3], Deakin [2], Matsumura [5] and others. In his pioneering work [3], Duff studied the location and structures of singularities of reflected Riemann functions making use of the stationary phase method. Deakin [2] treated first order hyperbolic systems by the same method. However, it seems that it is difficult to apply the stationary phase method to the study of Riemann functions of more general hyperbolic mixed problems. Matsumura [5] gave an inner estimate of the location of singularities of reflected Riemann functions which correspond to reflected waves making use of the localization method developed by Atiyah, Bott and Gårding [1] and Hörmander [4]. A localization theorem describing the location of singularities of reflected Riemann functions which correspond to lateral waves was obtained by the author [8] under some restrictive assumptions.

In this paper we shall deal with hyperbolic mixed problems in a quarter-space under more general assumptions and prove a localization theorem describing the location of singularities of reflected Riemann functions which correspond to reflected waves, lateral waves and boundary waves. Tsuji [7] studied the same problem in the cases where $P(\xi), B_{j}(\xi)$ are homogeneous and obtained similar results. We originally

[^0]formulated and proved our localization theorem making use of the representations of reflected Riemann functions given in [5], [8]. However we can give a simpler proof if we use the representation of reflected Riemann functions given in Tsuji [7]. So we shall give our proof using the representation.

Now let us state our problems, assumptions and main results. Let $\mathbf{R}^{n}$ denote the $n$-dimensional Euclidean space and $\Xi^{n}$ its real dual space and write $x^{\prime}=\left(x_{1}, \ldots, x_{n-1}\right), x^{\prime \prime}=\left(x_{2}, \ldots, x_{n}\right)$ for the coordinate $x=\left(x_{1}, \ldots, x_{n}\right) \quad$ in $\quad \mathbf{R}^{n} \quad$ and $\quad \xi^{\prime}=\left(\xi_{1}, \ldots, \xi_{n-1}\right), \xi^{\prime \prime}=\left(\xi_{2}, \ldots, \xi_{n}\right), \xi^{\prime \prime \prime}=\left(\xi_{2}, \ldots\right.$, $\left.\xi_{n-1}\right)$ for the dual coordinate $\xi=\left(\xi_{1}, \ldots, \xi_{n}\right)$. The variable $x_{1}$ will play the role of "time", the variables $x_{2}, \ldots, x_{n}$ will play the role of "space". We shall also denote by $\mathbb{R}_{+}^{n}$ the half-space $\left\{x=\left(x^{\prime}, x_{n}\right) \in \mathbb{R}^{n} ; x_{n}>0\right\}$. For differentiation we will use the symbol $D=i^{-1}\left(\partial / \partial x_{1}, \ldots, \partial / \partial x_{n}\right)$. Let $P=P(\xi)$ be a hyperbolic polynomial of order $m$ of $n$ variables $\xi$ with respect to $\vartheta=(1,0, \ldots, 0) \in \Xi^{n}$ in the sense of Gårding, i.e. $P^{0}(\vartheta) \neq 0$ and $P(\xi+s \vartheta) \neq 0$ when $\xi$ is real and $\operatorname{Im} s<-\gamma_{0}$, where $P^{0}$ denotes the principal part of $P$. We consider the mixed initial-boundary value problem for the hyperbolic operator $P(D)$ in a quarter-space

$$
\begin{align*}
& P(D) u(x)=f(x), \quad x \in \mathbb{R}_{+}^{n}, \quad x_{1}>0,  \tag{1.1}\\
& \left(D_{1}^{k} u\right)\left(0, x^{\prime \prime}\right)=0, \quad 0 \leqq k \leqq m-1, \quad x_{n}>0,  \tag{1.2}\\
& \left.B_{j}(D) u(x)\right|_{x_{n}=0}=0, \quad 1 \leqq j \leqq l, \quad x_{1}>0 . \tag{1.3}
\end{align*}
$$

Here the $B_{j}(D)$ are boundary operators with constant coefficients. The number $l$ of boundary conditions will be determined later on. We assume that the hyperplane $x_{n}=0$ is non-characteristic for $P(D)$.

Let us denote by $\operatorname{Re} A$ be the real hypersurface $\left\{\xi \in \Xi^{n} ; P^{0}(\xi)=0\right\}$ and by $\Gamma=\Gamma(P, \vartheta)\left(\subset \Xi^{n}\right)$ the component of $\Xi^{n} \backslash \operatorname{Re} A$ which contains ษ. When $\xi^{\prime} \in \Xi^{n-1}-i \gamma_{0} \vartheta^{\prime}-i \Gamma_{0}$, we can denote the roots of $P\left(\xi^{\prime}, \lambda\right)=0$ with respect to $\lambda$ by $\lambda_{1}^{+}\left(\xi^{\prime}\right), \ldots, \lambda_{l}^{+}\left(\xi^{\prime}\right), \lambda_{1}^{-}\left(\xi^{\prime}\right), \ldots, \lambda_{m-l}^{-}\left(\xi^{\prime}\right)$, which are enumerated so that

$$
\begin{array}{ll}
\operatorname{Im} \lambda_{k}^{+}\left(\xi^{\prime}\right)>0, & 1 \leqq k \leqq l,  \tag{1.4}\\
\operatorname{Im} \lambda_{k}^{-}\left(\xi^{\prime}\right)<0, & 1 \leqq k \leqq m-l .
\end{array}
$$

Here $\Gamma_{0}$ denotes the set $\left\{\eta^{\prime} \in \Xi^{n-1} ;\left(\eta^{\prime}, 0\right) \in \Gamma\right\}$. The number $l$ in (1.4) determines that of boundary conditions. Put

$$
\begin{equation*}
P_{+}\left(\xi^{\prime}, \lambda\right)=\prod_{j=1}^{l}\left(\lambda-\lambda_{j}^{+}\left(\xi^{\prime}\right)\right), \quad \xi^{\prime} \in \Xi^{n-1}-i \gamma_{0} \vartheta^{\prime}-i \Gamma_{0} . \tag{1.5}
\end{equation*}
$$

We now define the Lopatinski determinant for the system $\left\{P, B_{j}\right\}$ by

$$
\begin{gather*}
R\left(\xi^{\prime}\right)=\operatorname{det}\left(\frac{1}{2 \pi i} \oint \frac{B_{j}\left(\xi^{\prime}, \lambda\right) \lambda^{k-1}}{P_{+}\left(\xi^{\prime}, \lambda\right)} d \lambda\right)_{j, k=1, \ldots, l},  \tag{1.6}\\
\xi^{\prime} \in \Xi^{n-1}-i \gamma_{0} \vartheta^{\prime}-i \Gamma_{0} .
\end{gather*}
$$

We remark that

$$
\begin{gather*}
R\left(\xi^{\prime}\right)=\operatorname{det}\left(B_{j}\left(\xi^{\prime}, \lambda_{k}^{+}\left(\xi^{\prime}\right)\right)\right) / \Pi_{1 \leqq j<k \leqq l}\left(\lambda_{j}^{+}\left(\xi^{\prime}\right)-\lambda_{k}^{+}\left(\xi^{\prime}\right)\right),  \tag{1.7}\\
\xi^{\prime} \in \Xi^{n-1}-i \gamma_{0} \vartheta^{\prime}-i \Gamma_{0} .
\end{gather*}
$$

We state the assumptions that we impose on $\left\{P, B_{j}\right\}$ :

$$
\begin{equation*}
P(\xi)=p_{1}(\xi)^{v_{1}} \ldots p_{q}(\xi)^{v_{q}}, \tag{A.1}
\end{equation*}
$$

where the $p_{j}(\xi)$ are distinct strictly hyperbolic polynomials with respect to $\vartheta$ and irreducible over the complex number field $\mathbf{C}$.
(A. 2) The system $\left\{P, B_{j}\right\}$ is $\mathscr{E}$-well posed, i.e.

$$
\begin{aligned}
& R\left(\xi^{\prime}+s \vartheta^{\prime}\right) \neq 0 \text { for } \xi^{\prime} \in \Xi^{n-1} \text { and } \operatorname{Im} s<-\gamma_{1}, \\
& \tilde{R}_{0}\left(\vartheta^{\prime}\right) \neq 0,
\end{aligned}
$$

where $\widetilde{R}_{0}\left(\xi^{\prime}\right)$ denotes the principal part of $R\left(\xi^{\prime}\right)$ defined by (2.6) (see Sakamoto [6]).

Now we can construct the Riemann function $G(x, y)$ for $\left\{P, B_{j}\right\}$ which describes the propagation of waves produced by unit impulse given at position $y=\left(0, y_{2}, \ldots, y_{n}\right) \in \mathbf{R}_{+}^{n}$ (see [6], [7]). Write

$$
\begin{gather*}
G(x, y)=E(x-y)-F(x, y), \quad x \in \mathbf{R}_{+}^{n}, \quad x_{1}>0,  \tag{1.8}\\
y=\left(0, y_{2}, \ldots, y_{n}\right) \in \mathbf{R}_{+}^{n},
\end{gather*}
$$

where $E(x)$ is the fundamental solution represented by

$$
\begin{equation*}
E(x)=(2 \pi)^{-n} \int_{\Xi^{n}} \exp [i x \cdot(\xi+i \eta)] P(\xi+i \eta)^{-1} d \xi, \quad \eta \in-\gamma_{0} \vartheta-\Gamma \tag{1.9}
\end{equation*}
$$

Then the reflected Riemann function $F(x, y)$ is written in the form

$$
\begin{align*}
& F(x, y)=(2 \pi)^{-(n+1)} \int_{\Xi^{n+1}} \frac{1}{i} \sum_{j, k=1}^{l} \exp \left[i \left\{\left(x^{\prime}-y^{\prime}\right) \cdot\left(\xi^{\prime}+i \eta^{\prime}\right)\right.\right.  \tag{1.10}\\
& \left.\left.\quad+\lambda x_{n}-y_{n}\left(\xi_{n}+i \eta_{n}\right)\right\}\right] \frac{R_{j k}\left(\xi^{\prime}+i \eta^{\prime}\right) B_{k}(\xi+i \eta) \lambda^{j-1}}{R\left(\xi^{\prime}+i \eta^{\prime}\right) P_{+}\left(\xi^{\prime}+i \eta^{\prime}, \lambda\right) P(\xi+i \eta)} d \xi d \lambda,
\end{align*}
$$

where $\eta \in-\gamma_{0} \vartheta-\Gamma$ and $\eta^{\prime} \in-\gamma_{0} \vartheta^{\prime}-\Gamma_{0}$. Here $R_{j k}\left(\xi^{\prime}\right)=(k, j)$-cofactor of $\left(\frac{1}{2 \pi i} \oint \frac{B_{j}\left(\xi^{\prime}, \lambda\right) \lambda^{k-1}}{P_{+}\left(\xi^{\prime}, \lambda\right)} d \lambda\right)_{j, k=1, \ldots, i} . F(x, y)$ has to be interpreted in the sense of distribution with respect to $(x, y) \in \mathbf{R}_{+}^{n} \times \mathbf{R}_{+}^{n}$.

Let $\mu_{1}^{+}\left(\xi^{\prime}\right), \ldots, \mu_{l}^{+}\left(\xi^{\prime}\right), \mu_{1}^{-}\left(\xi^{\prime}\right), \ldots, \mu_{m-l}^{-}\left(\xi^{\prime}\right)$ be the roots of $P^{0}\left(\xi^{\prime}, \mu\right)=0$. Since

$$
\begin{equation*}
t^{-m} P\left(t \xi^{\prime}, t \mu\right) \longrightarrow P^{0}\left(\xi^{\prime}, \mu\right) \quad \text { as } \quad t \longrightarrow \infty, \tag{1.11}
\end{equation*}
$$

it follows that,

$$
\begin{equation*}
t^{-1} \lambda_{k}^{ \pm}\left(t \xi^{\prime}\right) \longrightarrow \mu_{k}^{ \pm}\left(\xi^{\prime}\right) \quad \text { as } \quad t \longrightarrow \infty, \tag{1.12}
\end{equation*}
$$

if the $\mu$ 's are labelled suitably. Then our main result is stated as follows:

Theorem 1.1. Let $\xi^{0} \in \Xi^{n}$ and $\mu^{0}$ be real. Then we have

$$
\begin{gather*}
t^{p_{0}} \exp \left[-i t\left\{\left(x^{\prime}-y^{\prime}\right) \cdot \xi^{0^{\prime}}+x_{n} \mu^{0}-y_{n} \xi_{n}^{0}\right\}\right] F(x, y)  \tag{1.13}\\
\sim \sum_{j=0}^{\infty} F_{j}(x, y) t^{-j / L},
\end{gather*}
$$

where $p_{0}$ is a rational number and $L$ is a positive integer. Here (1.13) implies that

$$
\begin{align*}
& t^{N / L}\left\{t^{p_{0}} \exp \left[-i t\left\{\left(x^{\prime}-y^{\prime}\right) \cdot \xi^{0}+x_{n} \mu^{0}-y_{n} \xi_{n}^{0}\right\}\right] F(x, y)\right.  \tag{1.14}\\
& \left.\quad-\sum_{j=0}^{N-1} F_{j}(x, y) t^{-j / L}\right\} \longrightarrow F_{N}(x, y) \text { as } t \longrightarrow \infty, \quad N=0,1,2, \ldots
\end{align*}
$$

in the sense of distribution with respect to $(x, y) \in \mathbf{R}_{+}^{n} \times \mathbf{R}_{+}^{n}$. Moreover, for $\xi^{0} \neq 0$ we have

$$
\begin{equation*}
\cup_{j=0}^{\infty} \operatorname{supp} F_{j}(x, y) \subset \operatorname{sing} \operatorname{supp} F(x, y) \tag{1.15}
\end{equation*}
$$

and

$$
\begin{align*}
& \operatorname{supp} F_{j}(x, y) \subset\left\{(x, y) \in \mathbf{R}_{+}^{n} \times \mathbf{R}_{+}^{n} ;\right.  \tag{1.16}\\
& \left.\left(x^{\prime}-y^{\prime}\right) \cdot \eta^{\prime}-y_{n} \eta_{n}+x_{n} \lambda \geqq 0 \text { for all }(\eta, \lambda) \in \Gamma_{\xi^{0}, \mu^{0}}\right\},
\end{align*}
$$

where $\Gamma_{\xi^{0}, \mu^{0}}$ will be defined by (4.4).
Remark 1. The corresponding result for the fundamental solution $E(x)$ was obtained in [1], i.e.

$$
\begin{gather*}
t^{m-p^{2}} \exp \left[-i t x \cdot \xi^{0}\right] E(x) \longrightarrow E_{\xi^{0}}(x) \quad \text { as } \quad t \longrightarrow \infty  \tag{1.17}\\
E_{\xi^{0}}(x)=(2 \pi)^{-n} \int_{\Xi^{n}} \exp [i x \cdot(\xi+i \eta)] P_{\xi^{0}}(\xi+i \eta)^{-1} d \xi \\
\eta \in-\gamma_{0} \vartheta-\Gamma
\end{gather*}
$$

where the localization $P_{\xi^{0}}$ of $P$ at $\xi^{0}$ is defined by

$$
\begin{equation*}
v^{m} P\left(v^{-1} \xi^{0}+\eta\right)=v^{p} P_{\xi^{0}}(\eta)+0\left(v^{p+1}\right) \quad \text { as } \quad v \longrightarrow 0 . \tag{1.19}
\end{equation*}
$$

## Remark 2.

$$
\begin{align*}
& \left\{(x, y) \in \mathbf{R}_{+}^{n} \times \mathbf{R}_{+}^{n} ;\left(x^{\prime}-y^{\prime}\right) \cdot \eta^{\prime}-y_{n} \eta_{n}+x_{n} \lambda \geqq 0 \quad\right. \text { for }  \tag{1.20}\\
& \text { all } \left.\quad(\eta, \lambda) \in \Gamma_{\xi^{0}, \mu^{0}}\right\} \\
& =\cup_{\substack{\theta_{1}+\cdots+\cdots r_{0}=1 \\
\theta_{1}, \ldots, \theta_{r_{0}} \geqq 0}}\left\{(x, y) \in \mathbf{R}_{+}^{n} \times \mathbf{R}_{+}^{n} ;\left[\left(x^{\prime}-y^{\prime}\right)\right.\right. \\
& \left.\quad+x_{n}\left(\theta_{1} \operatorname{grad} \mu_{1}^{+}\left(\xi^{0^{\prime}}\right)+\cdots+\theta_{r_{0}} \operatorname{grad} \mu_{r_{0}}^{+}\left(\xi^{0}\right)\right)\right] \cdot \eta^{\prime} \\
& \left.\quad-y_{n} \eta_{n} \geqq 0 \quad \text { for all } \eta \in \Gamma\left(P_{\xi^{0}}, \vartheta\right) \cap\left(\dot{\Sigma}_{\xi^{0}} \times \Xi\right)\right\},
\end{align*}
$$

where $\mu_{k}^{+}\left(\xi^{\prime}\right), 1 \leqq k \leqq r_{0}$, are the simple roots of $p_{j}^{0}\left(\xi^{\prime}, \mu\right)=0$ for $\mid \xi^{\prime}$ $-\xi^{0^{\prime}} \mid<\varepsilon$ such that $\mu_{k}^{+}\left(\xi^{0^{\prime}}\right)=\mu^{0}$, and $\dot{\Sigma}_{\xi^{0}}$, will be defined by (3.5). Using the representations of reflected Riemann functions given in [8], we originally obtained

$$
\begin{equation*}
\operatorname{supp} F_{j}(x, y) \subset \cup_{\substack{\theta_{1}+\ldots+\theta r_{0}=1 \\ \theta_{1}, \ldots, \theta_{r_{0}} \geq 0}}\left\{(x, y) \in \mathbf{R}_{+}^{n} \times \mathbf{R}_{+}^{n} ;\right. \tag{1.21}
\end{equation*}
$$

$$
\begin{aligned}
& {\left[\left(x^{\prime}-y^{\prime}\right)+x_{n}\left(\theta_{1} \operatorname{grad} \mu_{1}^{+}\left(\xi^{0^{\prime}}\right)+\cdots+\theta_{r_{0}} \operatorname{grad} \mu_{r_{0}}^{+}\left(\xi^{0^{\prime}}\right)\right)\right] \cdot \eta^{\prime}} \\
& \left.-y_{n} \eta_{n} \geqq 0 \quad \text { for all } \quad \eta \in \Gamma\left(P_{\xi^{0}}, \vartheta\right) \cap\left(\dot{\Sigma}_{\xi^{0}} \times \Xi\right)\right\} .
\end{aligned}
$$

Remark 3. Tsuji [7] also proved (1.13)-(1.15) in the cases where $P(\xi), B_{j}(\xi)$ are homogeneous.

The remainder of this paper is organized as follows. In $\S 2$ we shall study some properties of the roots $\lambda_{j}\left(\xi^{\prime}\right)$. In $\S 3$ the localization of the Lopatinski determinant will be defined and its properties will be studied. In $\S 4$ we shall prove the localization theorem (Theorem 1.1). Some examples will be given in §5.

The author would like to express his sincere gratitude to Professor M. Matsumura for many valuable suggestions.

## § 2. Algebraic Considerations and Lopatinski Determinant

Put

$$
\begin{align*}
& \left.\sigma\left(\xi^{\prime \prime}\right)=\max _{P O}^{P( }\right)=0  \tag{2.1}\\
& \tilde{\sigma}\left(\xi_{1} \quad \text { for } \quad \xi^{\prime \prime \prime}\right)=\inf _{\xi_{n} \in \Xi} \sigma\left(\xi^{\prime \prime}\right) \quad \text { for } \quad \xi^{n-1} \in \Xi^{n-2},  \tag{2.2}\\
& \dot{\Gamma}=\left\{\xi^{\prime} \in \Xi^{n-1} ; \xi_{1}>\tilde{\sigma}\left(\xi^{\prime \prime \prime}\right)\right\} . \tag{2.3}
\end{align*}
$$

Then it is obvious that

$$
\begin{align*}
& \Gamma=\left\{\xi \in \Xi^{n} ; \xi_{1}>\sigma\left(\xi^{\prime \prime}\right)\right\},  \tag{2.4}\\
& \Gamma_{0} \subset \dot{\Gamma} . \tag{2.5}
\end{align*}
$$

Lemma $2.1([6]) . \quad R\left(\xi^{\prime}\right)$ is holomorphic in $\Xi^{n-1}-i \gamma_{0} \vartheta^{\prime}-i \Gamma^{\circ}$.
Lemma 2.2 ([6]). Let $K$ be a compact set in $\Xi^{n-1}-i \dot{\Gamma}$, then there exists $T_{\mathrm{K}}>0$ such that

$$
\begin{equation*}
R\left(t \xi^{\prime}\right)=t^{h_{0}}\left\{\widetilde{R}_{0}\left(\xi^{\prime}\right)+t^{-1} \widetilde{R}_{1}\left(\xi^{\prime}\right)+t^{-2} \widetilde{R}_{2}\left(\xi^{\prime}\right)+\cdots\right\} \tag{2.6}
\end{equation*}
$$

whose convergence is uniform in $K \times\left\{t>T_{K}\right\}$, where
(i) $\left\{\widetilde{R}_{j}\left(\xi^{\prime}\right)\right\}$ are holomorphic in $\dot{\Gamma}=\cup_{z \in \mathbf{C}\{0\}} z\left(\Xi^{n-1}-i \dot{\Gamma}\right)$,
(ii) $\widetilde{R}_{j}\left(t \xi^{\prime}\right)=t^{h_{0}-j} \tilde{R}_{j}\left(\xi^{\prime}\right) \quad$ for $\quad \xi^{\prime} \in \dot{\Gamma}, \quad t \in \mathbf{C} \backslash\{0\}$,
(iii) $\widetilde{R}_{0}\left(\xi^{\prime}\right) \not \equiv 0$ and $h_{0}$ is an integer.

Put

$$
\begin{gather*}
\dot{\sigma}\left(\xi^{\prime \prime \prime}\right)=\left\{\begin{array}{lll}
\tilde{\sigma}\left(\xi^{\prime \prime \prime}\right) & \text { if } & \tilde{R}_{0}\left(\xi^{\prime}\right) \neq 0 \text { for } \xi^{\prime} \in \dot{\Gamma}, \\
\sup _{\substack{\tilde{R}_{0}\left(\xi^{\prime}\right)=0 \\
\xi^{\prime} \in \dot{\Gamma}}} \xi_{1} & \text { otherwise },
\end{array}\right.  \tag{2.7}\\
\dot{\Sigma}=\left\{\xi^{\prime} \in \Xi^{n-1} ; \xi_{1}>\dot{\sigma}\left(\xi^{\prime \prime \prime}\right)\right\} . \tag{2.8}
\end{gather*}
$$

Then it follows from (A.2) that $\vartheta^{\prime} \in \dot{\Sigma}$.
Lemma 2.3 ([6]). There exists a positive constant $\gamma_{1}$ such that

$$
\begin{equation*}
R\left(\xi^{\prime}\right) \neq 0 \quad \text { for } \quad \xi^{\prime} \in \Xi^{n-1}-i \gamma_{1} \vartheta^{\prime}-i \dot{\Sigma} . \tag{2.9}
\end{equation*}
$$

Moreover, for any compact set $K$ in $\gamma_{1} \vartheta^{\prime}+\dot{\Sigma}$ there exist positive constants $c_{K}$ and $a_{K}$ such that

$$
\begin{equation*}
\left|R\left(\xi^{\prime}\right)\right| \geqq c_{K}\left|\xi^{\prime}\right|^{-a_{K}} \quad \text { for } \quad \xi^{\prime} \in \Xi^{n-1}-i \Lambda_{K}, \tag{2.10}
\end{equation*}
$$

where $\Lambda_{K}=\left\{t \xi^{\prime}, \xi^{\prime} \in K, t \geqq 1\right\}$.
Let $p(\xi)$ be a strictly hyperbolic polynomial with respect to $\vartheta$ and assume that $p^{0}(0,1) \neq 0, p(\xi) \neq 0$ for $\xi \in \Xi^{n}-i \gamma_{0} \vartheta-i \Gamma$. We consider the real roots of $p\left(\xi^{\prime}, \lambda\right)=0$ in a neighborhood of $\xi^{\prime}=\xi^{0}$, where $\xi^{0^{\prime} \in \Xi^{n-1} \backslash}$ $\{0\}$ is arbitrarily fixed. Put

$$
\begin{equation*}
p\left(\xi^{\prime}, \lambda ; v\right)=p^{0}\left(\xi^{\prime}, \lambda\right)+v p^{1}\left(\xi^{\prime}, \lambda\right)+\cdots+v^{\tilde{m}} p^{\tilde{m}}\left(=v^{\tilde{m}} p\left(v^{-1} \xi^{\prime}, v^{-1} \lambda\right)\right) \tag{2.11}
\end{equation*}
$$

where $\operatorname{deg} p=\tilde{m}$. We can assume without loss of generality that $\lambda=0$ is an $l$-ple root of $p^{0}\left(\xi^{0}, \lambda\right)=0$. Therefore we have

$$
\begin{array}{r}
p\left(\xi^{\prime}, \lambda ; v\right)=\left(\lambda^{l}+a_{1}\left(\xi^{\prime} ; v\right) \lambda^{l-1}+\cdots+a_{l}\left(\xi^{\prime} ; v\right)\right) q\left(\xi^{\prime}, \lambda ; v\right)  \tag{2.12}\\
\text { for }\left|\xi^{\prime}-\xi^{0^{\prime}}\right|<\varepsilon \text { and }|v|<\varepsilon,
\end{array}
$$

where the $a_{j}\left(\xi^{\prime} ; v\right)$ and $q\left(\xi^{\prime}, \lambda ; v\right)$ are holomorphic for $\left|\xi^{\prime}-\xi^{0}\right|<\varepsilon$ and $|v|<\varepsilon$ and $a_{j}\left(\xi^{0^{\prime}} ; 0\right)=0$ and $q\left(\xi^{\prime}, \lambda ; v\right) \neq 0$ for $\left|\xi^{\prime}-\xi^{0^{\prime}}\right|<\varepsilon,|v|<\varepsilon$ and $|\lambda|<\varepsilon$. Then

$$
\begin{equation*}
a_{j}\left(\xi^{\prime} ; v\right)=\sum_{k+|\alpha| \geqq 1} a_{j k \alpha} v^{k}\left(\xi^{\prime}-\xi^{0^{\prime}}\right)^{\alpha}, \quad|v|<\varepsilon, \quad\left|\xi^{\prime}-\xi^{0^{\prime}}\right|<\varepsilon, \tag{2.13}
\end{equation*}
$$

and, therefore,

$$
\begin{equation*}
a_{j}\left(\xi^{\prime}+v \eta^{\prime} ; v\right)=\sum_{k=1}^{\infty} a_{j k}\left(\eta^{\prime}\right) v^{k}, \tag{2.14}
\end{equation*}
$$

where

$$
\begin{equation*}
a_{j k}\left(\eta^{\prime}\right)=\sum_{i+|\alpha|=k} a_{j i \alpha} \eta^{\prime \alpha} . \tag{2.15}
\end{equation*}
$$

Lemma 2.4. Let $\tau\left(\xi^{\prime \prime}\right)$ be a root of $p^{0}\left(\tau, \xi^{\prime \prime}\right)=0$ such that $\tau\left(\xi^{0 \prime \prime}, 0\right)$ $=\xi_{1}^{0}$. Then
(2.16) $a_{l 1}\left(\eta^{\prime}\right)=\left.\frac{\partial}{\partial v} a_{l}\left(\xi^{0 \prime}+v \eta^{\prime} ; v\right)\right|_{v=0}$

$$
\begin{aligned}
& =\text { const. }{ }^{1)}\left(\left.\frac{\partial}{\partial v} p^{0}\left(\xi^{0 \prime}+v \eta^{\prime}, 0\right)\right|_{v=0}+p^{1}\left(\xi^{0^{\prime}}, 0\right)\right) \\
& =\text { const. }\left[\text { const. }\left(\eta_{1}-\sum_{j=2}^{n-1} \frac{\partial \tau}{\partial \xi_{j}}\left(\xi^{0^{\prime \prime \prime}}, 0\right) \eta_{j}\right)+p^{1}\left(\xi^{0^{\prime}}, 0\right)\right]
\end{aligned}
$$

Moreover if $l>1$,

$$
\begin{equation*}
a_{l 1}\left(\eta^{\prime}\right)=\text { const. } p_{\left(\xi^{0}, 0\right)}(\eta) \tag{2.17}
\end{equation*}
$$

where $p_{\left(\xi^{0}, 0\right)}$ is the localization of $p$ at $\left(\xi^{0^{\prime}}, 0\right)$ defined by (1.19). Therefore

$$
\begin{equation*}
a_{l 1}\left(\eta^{\prime}\right) \neq 0 \quad \text { for } \quad \eta^{\prime} \in \Xi^{n-1}-i \gamma_{0} \vartheta^{\prime}-i \dot{\Gamma} \tag{2.18}
\end{equation*}
$$

Proof. (2.16) is obvious. Since $p(\xi)$ is a strictly hyperbolic polynomial,

$$
p_{\left(\xi^{0}, 0\right)}(\eta)=\sum_{j=1}^{n} \frac{\partial p^{0}}{\partial \xi_{j}}\left(\xi^{0^{\prime}}, 0\right) \eta_{j}+p^{1}\left(\xi^{0^{\prime}}, 0\right) .
$$

If $\lambda=0$ is a multiple root of $p^{0}\left(\xi^{0^{\prime}}, \lambda\right)=0, \frac{\partial p^{0}}{\partial \xi_{n}}\left(\xi^{0^{\prime}}, 0\right)=0$. This proves (2.17). Since $\Gamma \subset \Gamma\left(p_{\left(5^{\circ}, 0\right)}, \vartheta\right)$, (2.18) can be obtained (see [1]). Q.E.D.

1) Here and in sequal const. denotes a non-zero constant.

Let $\zeta\left(\xi^{\prime} ; v\right)$ be a root of $p\left(\xi^{\prime}, \lambda ; v\right)=0$ such that $\zeta\left(\xi^{0^{\prime}} ; 0\right)=0$. Then we have the following

Lemma 2.5. For any compact set $K$ in $\Xi^{n-1}-i \gamma_{0} \vartheta^{\prime}-i \dot{\Gamma}$ and any positive integer $N$ there exists $\varepsilon>0$ such that

$$
\begin{equation*}
\zeta\left(\xi^{\prime \prime}+v \eta^{\prime} ; v\right)=\sum_{j=1}^{N} c_{j}\left(\eta^{\prime}\right) v^{j / l}+0\left(v^{(N+1) / l}\right) \tag{2.19}
\end{equation*}
$$

if $\eta^{\prime} \in K$ and $|\nu|<\varepsilon$. If $l=1$, the $c_{j}\left(\eta^{\prime}\right)$ are polynomials of $\eta^{\prime}$, and if $l>1$, the $c_{j}\left(\eta^{\prime}\right)$ are equal to (polynomial of $\left.\eta^{\prime}\right) \times c_{1}\left(\eta^{\prime}\right)^{-n_{j}}$, where the $n_{j}$ are integers. In particular,

$$
\begin{equation*}
c_{1}\left(\eta^{\prime}\right)=\left\{-a_{l 1}\left(\eta^{\prime}\right)\right\}^{1 / l} . \tag{2.20}
\end{equation*}
$$

Remark. We can also prove the following assertion: For any compact set $K^{\prime}$ in $\gamma_{0} \vartheta^{\prime}+\dot{\Gamma}$ and any positive integer $N$ there exist positive constants $\alpha_{N}, \beta_{N}, \varepsilon$ and $d$ such that

$$
\begin{equation*}
\zeta\left(\xi^{0^{\prime}}+v \eta^{\prime} ; v\right)=\sum_{j=1}^{N} c_{j}\left(\eta^{\prime}\right) \nu^{j / l}+0\left(\nu^{N / l+\beta_{N}}\right) \tag{2.21}
\end{equation*}
$$

if $\eta^{\prime} \in \Xi^{n-1}-i K^{\prime},\left|\eta^{\prime}\right| \leqq d|\nu|^{-\alpha_{N}}$ and $|\nu|<\varepsilon$.
Proof. ${ }^{2)}$ (i) If $l=1$, then $\zeta\left(\xi^{\prime} ; v\right)=-a_{1}\left(\xi^{\prime} ; v\right)=-\sum_{j=1}^{\infty} a_{1 j}\left(\eta^{\prime}\right) v^{j}$. Thus the assertions of Lemma 2.5 are obvious.
(ii) Let us prove Lemma 2.5 when $l>1$. From (2.14) and (2.18) $\zeta\left(\xi^{0^{\prime}}+v \eta^{\prime} ; v\right)$ can be represented for fixed $\eta^{\prime} \in K$ by a development in a Puiseux series of the form

$$
\zeta\left(\xi^{0^{\prime}}+v \eta^{\prime} ; v\right)=\sum_{j=1}^{\infty} c_{j}\left(\eta^{\prime}\right) \nu^{j / l} .
$$

Then we have

$$
c_{1}\left(\eta^{\prime}\right)=\left\{-a_{l 1}\left(\eta^{\prime}\right)\right\}^{1 / l}, \quad d_{0} \leqq\left|c_{1}\left(\eta^{\prime}\right)\right|,
$$

2) It is possible to simplify this part, according to the referee's remark: $w\left(\eta^{\prime} ; \nu\right)=$ $\nu^{-1 / \nu} \zeta\left(\xi^{\circ}+\nu \eta^{\prime} ; \nu\right)$ is a root of the equation

$$
\lambda^{l}+a_{1}\left(\xi^{\prime}+\nu \eta^{\prime} ; \nu\right) \nu^{-1 / l} \lambda^{l-1}+\cdots+a_{l}\left(\xi^{0 \prime}+\nu \eta^{\prime} ; \nu\right) \nu^{-1}=0 .
$$

On the other hand the $b_{j}\left(\eta^{\prime} ; \mu\right) \equiv a_{j}\left(\xi^{0}+\mu^{l} \eta^{\prime} ; \mu^{l}\right) \mu^{-j}$ are holomorphic in $\left(\eta^{\prime}, \mu\right) \in$ $K \times\left\{|\mu|<\varepsilon^{\prime}\right\}$ and $b_{j}\left(\eta^{\prime} ; 0\right)=0,1 \leqq j \leqq l-1$ and $b_{l}\left(\eta^{\prime} ; 0\right) \neq 0$ for $\eta^{\prime} \in K$. Thus we see that $w\left(\eta^{\prime} ; \mu^{l}\right)$ is holomorphic in $\left(\eta^{\prime}, \mu\right) \in K \times\left\{|\mu|<\varepsilon^{\prime}\right\}$ and that $\zeta\left(\xi^{\circ}+\right.$ $\left.\nu \eta^{\prime} ; \nu\right)=\sum_{j=1}^{\infty} c_{j}\left(\eta^{\prime}\right) \nu^{j / l}$ is convergent if $\left(\eta^{\prime}, \nu\right) \in K \times\{|\nu|<\varepsilon\}$.

$$
\begin{equation*}
\left|c_{j}\left(\eta^{\prime}\right)\right| \leqq d_{j}, \quad j=1,2, \ldots \tag{2.22}
\end{equation*}
$$

In fact, from the equation

$$
\begin{aligned}
& l c_{1}\left(\eta^{\prime}\right)^{l-1} c_{j}\left(\eta^{\prime}\right)+\sum_{\substack{1 \leq j_{1}, \ldots, j_{1} \leq j-1 \\
j_{1}+\ldots+j_{l}=l-1+j}} c_{j_{1}}\left(\eta^{\prime}\right) \ldots c_{j_{l}}\left(\eta^{\prime}\right) \\
& \quad+\sum_{k=0}^{l-1} \sum_{\substack{1 \leq j_{1}, \ldots, j_{k} \leq j-1 \\
l h^{\prime}+j_{1}+\cdots+j_{k}=l-1+j}} c_{j_{1}}\left(\eta^{\prime}\right) \ldots c_{j_{k}}\left(\eta^{\prime}\right) a_{l-k, h}\left(\eta^{\prime}\right)=0,
\end{aligned}
$$

we determine $c_{j}\left(\eta^{\prime}\right), j=2,3, \ldots$. Thus we obtain the estimates (2.22). Moreover we have

$$
\left|c_{j}\left(\eta^{\prime}\right)\right| \leqq d_{j}^{\prime}\left(1+\left|\eta^{\prime}\right|\right)^{j / l+r_{j}}, \quad j=1,2, \ldots
$$

where $r_{j}=-1 / l+l^{j-2}(\geqq 0)$, which is used in order to prove (2.21). Putting

$$
\zeta\left(\xi^{0^{\prime}}+v \eta^{\prime} ; v\right)=\sum_{j=1}^{N} c_{j}\left(\eta^{\prime}\right) v^{j / l}+\zeta_{N+1}\left(\eta^{\prime} ; v\right),
$$

we shall estimate $\zeta_{N+1}\left(\eta^{\prime} ; v\right)$ in the remainder of this proof. Write $\lambda^{l}$ $+a_{1}\left(\xi^{0^{\prime}}+v \eta^{\prime} ; v\right) \lambda^{l-1}+\cdots+a_{l}\left(\xi^{0^{\prime}}+v \eta^{\prime} ; v\right)=0$ in the form

$$
\begin{equation*}
\lambda^{l}=-\sum_{j=1}^{l}\left[\sum_{k=1}^{N_{j}} a_{j k}\left(\eta^{\prime}\right) v^{k}+0\left(v^{N_{j}+1}\right)\right] \lambda^{l-j}, \tag{2.23}
\end{equation*}
$$

where $N_{l-j}=1+[(N-j-1) / l], 0 \leqq j \leqq l-1$. Substitution of $\lambda=\zeta\left(\xi^{0^{\prime}}+v \eta^{\prime}\right.$; $v)$ into (2.23) gives

$$
\begin{aligned}
& \sum_{k=0}^{l=1}\binom{l}{k}\left\{c_{1}\left(\eta^{\prime}\right)^{k} v^{k / l}+\sum_{\substack{1 \leq j_{1}, \ldots, j_{k} \leq N \\
j_{1}+\cdots+j_{k} \geqq k+1}} c_{j_{1}}\left(\eta^{\prime}\right) \ldots c_{j_{k}}\left(\eta^{\prime}\right) v^{\left(j_{1}+\cdots+j_{k}\right) / l}\right\} \\
& \times \zeta_{N+1}\left(\eta^{\prime} ; v\right)^{l-k}+\sum_{\substack{1 \leq j_{1}, \ldots \ldots j \leq j_{1} \leq j_{1} \\
j_{1}+\ldots+j_{l} \leqq l+N}} c_{j_{1}}\left(\eta^{\prime}\right) \ldots c_{j_{l}}\left(\eta^{\prime}\right) v^{\left(j_{1}+\cdots+j_{l}\right) / l} \\
& =-\sum_{h=1}^{L-1} \sum_{k=0}^{h-1} \sum_{1 \leqq j_{1}, \ldots, j_{k} \leqq N}\binom{h}{k} c_{j_{1}}\left(\eta^{\prime}\right) \ldots c_{j_{k}}\left(\eta^{\prime}\right) \\
& \times\left\{\sum_{q=1}^{N_{l}-h} a_{l-h, q}\left(\eta^{\prime}\right) v^{\left(j_{1}+\cdots+j_{k}\right) / l+q}+0\left(v^{\left(j_{1}+\cdots+j_{k}\right) / l+N_{l-h}+1}\right)\right\} \\
& \times \zeta_{N+1}\left(\eta^{\prime} ; v\right)^{h-k}-\sum_{h=0}^{l-1} \sum_{\substack{1 \leq j_{1}, \ldots, j_{h} \leq N \\
j_{1}, \ldots+j_{h}+i \bar{q} \geqq l+N}} c_{j_{1}}\left(\eta^{\prime}\right) \ldots c_{j_{h}}\left(\eta^{\prime}\right) \\
& \times a_{l-h, q}\left(\eta^{\prime}\right) \nu^{\left(j_{1}+\cdots+j_{h}\right) / l+q}-\sum_{h=0}^{l-1} \sum_{1 \leqq j_{1}, \ldots, j_{h} \leqq N} c_{j_{1}}\left(\eta^{\prime}\right) \ldots c_{j_{h}}\left(\eta^{\prime}\right) \\
& \times 0\left(v^{\left(j_{1}+\cdots+j_{h}\right) / l+N_{l-h}+1}\right) .
\end{aligned}
$$

Thus we have

$$
\begin{equation*}
\sum_{k=0}^{l=1}\binom{l}{k}\left\{c_{1}\left(\eta^{\prime}\right)^{k} v^{k / l}+0\left(v^{(k+1) / l}\right)\right\} \zeta_{N+1}\left(\eta^{\prime} ; v\right)^{l-k}+0\left(v^{N / l+1}\right)=0 . \tag{2.24}
\end{equation*}
$$

Substituting $\zeta_{N+1}\left(\eta^{\prime} ; v\right)=c_{1}\left(\eta^{\prime}\right) \nu^{1 / l} z\left(\eta^{\prime} ; v\right)$ into (2.24), we have

$$
\sum_{k=0}^{l-1}\binom{l}{k}\left\{c_{1}\left(\eta^{\prime}\right)^{l} v+c_{1}\left(\eta^{\prime}\right)^{l-k} 0\left(v^{1+1 / l}\right)\right\} z\left(\eta^{\prime} ; v\right)^{l-k}+0\left(v^{N / l+1}\right)=0
$$

Therefore,

$$
\sum_{k=0}^{l-1}\binom{l}{k}\left\{1+c_{1}\left(\eta^{\prime}\right)^{-k} 0\left(v^{1 / l}\right)\right\} z\left(\eta^{\prime} ; v\right)^{l-k}+0\left(v^{N / l}\right)=0
$$

Since the roots of

$$
\sum_{k=0}^{l-1}\binom{l}{k} z^{l-k}=z\left((z+1)^{l-1}+(z+1)^{l-2}+\cdots+1\right)=0
$$

are $0, e^{2 \pi k i / l}-1(1 \leqq k \leqq l-1)$, we obtain

$$
\left|\zeta_{N+1}\left(\eta^{\prime} ; v\right)\right| \geqq c|v|^{1 / l} \quad \text { or } \quad \leqq c^{\prime}|v|^{(N+1) / l} .
$$

On the other hand

$$
\left|\zeta_{N+1}\left(\eta^{\prime} ; v\right)\right| \leqq c\left(\eta^{\prime}\right) v^{(N+1) / l}
$$

holds for fixed $\eta^{\prime} \in K$ and sufficiently small $v$. Thus we have

$$
\left|\zeta_{N+1}\left(\eta^{\prime} ; v\right)\right| \leqq c^{\prime}|v|^{(N+1) / l} \quad \text { for } \quad \eta^{\prime} \in K \quad \text { and } \quad|v|<\varepsilon .
$$

Q.E.D.

By Lemma 2.5 the following lemma can be easily proved.
Lemma 2.6. For any compact set $K$ in $\Xi^{n-1}-i \gamma_{0} \vartheta^{\prime}-i \dot{\Gamma}$ and any non-negative integer $N$ there exists $\varepsilon>0$ such that if $\eta^{\prime} \in K$ and 0 $<\nu<\varepsilon$,

$$
\begin{equation*}
v^{h_{1}} R\left(v^{-1} \xi^{0}+\eta^{\prime}\right)=\sum_{j=0}^{N} Q_{j}\left(\eta^{\prime}\right) v^{j / L}+0\left(v^{(N+1) / L}\right) \tag{2.25}
\end{equation*}
$$

where $Q_{0}\left(\eta^{\prime}\right) \not \equiv 0, L$ is a positive integer and $h_{1}$ is a rational number. Moreover the $Q_{j}\left(\eta^{\prime}\right)$ are equal to $\sum_{\text {finite sum }}$ (polynomial of $\left.\eta^{\prime}\right) \times$
$\prod_{k=1}^{r_{1}} c_{1 j_{k}}\left(\eta^{\prime}\right)^{-n_{j k}}$ and holomorphic in $\Xi^{n-1}-i \gamma_{0} \vartheta^{\prime}-i \dot{\Gamma}_{\xi^{0}}$. Here $\left\{j_{k}\right\}_{1}$ $\leqq k \leqq r_{1}$ is the set of suffixes such that $p_{j_{k}}^{0}\left(\xi^{0^{\prime}}, \mu\right)=0$ has a real multiple root $\mu_{j_{k}}$ with multiplicity $l_{j_{k}}$ and

$$
\begin{align*}
& c_{1 j_{k}}\left(\eta^{\prime}\right)=\left[\text { const. } p_{j_{k}\left(\xi^{0}, \mu_{j_{k}}\right)}(\eta)\right]^{1 / l_{j_{k}},}  \tag{2.26}\\
& \dot{\Gamma}_{\xi^{0}} \times \Xi=\cap_{k=1}^{r_{1}=} \Gamma\left(p_{j_{k}\left(\xi^{\circ}, \mu_{j_{k}}\right)}, \vartheta\right) . \tag{2.27}
\end{align*}
$$

Remark. $\quad \dot{\Gamma}_{\xi^{0}} \supset \dot{\Gamma}$. Moreover $L=$ the L. C. M. of $\left\{l_{j_{k}}\right\}_{1 \leqq k \leqq r_{1}}$.

## §3. Localization

Definition 3.1. Let $\Delta$ be an open connected cone in $\Xi^{n}$ such that $\vartheta+\Delta \subset \Delta$ and let $f(\xi)$ be a holomorphic function in $\Xi^{n}-i \gamma_{0} \vartheta-i \Delta$. Then we say that $f_{\xi^{0}}(\eta)$ is the localization of $f(\xi)$ at $\xi^{0}$ in $\Xi^{n}$ if $f_{\xi^{0}}(\eta)$ does not vanish identically and is holomorphic in $\Xi^{n}-i \gamma_{0} \vartheta-i \Delta$ and

$$
\begin{align*}
& \nu^{h_{1}} f\left(\nu^{-1} \xi^{0}+\eta\right) \longrightarrow f_{\xi^{0}}(\eta) \text { as } v \longrightarrow+0 \text { for each fixed }  \tag{3.1}\\
& \eta \in \Xi^{n}-i \gamma_{0} \vartheta-i \Delta,
\end{align*}
$$

where $h_{1}$ is a rational number and depends on $\xi^{0}$.
Remark. $\quad R_{\xi^{0}}\left(\eta^{\prime}\right)=Q_{0}\left(\eta^{\prime}\right)$.
Lemma 3.1. $Q_{0}\left(\eta^{\prime}\right) \neq 0$ for $\eta^{\prime} \in \Xi^{n-1}-i \gamma_{1} \vartheta^{\prime}-i \dot{\Sigma}$.
Proof. Assume that there exists $\eta^{0 \prime}$ in $\Xi^{n-1}-i \gamma_{1} q^{\prime}-i \Sigma$ such that $Q_{0}\left(\eta^{0 \prime}\right)=0$. Since $Q_{0}\left(\eta^{\prime}\right) \not \equiv 0$, there exists $\zeta^{0^{\prime}}$ in $\Xi^{n-1}+i \Xi^{n-1}$ such that $\mu \zeta^{0^{\prime}}+\eta^{0^{\prime}} \in \Xi^{n-1}-i \gamma_{1} \vartheta^{\prime}-i \dot{\Sigma}$ for $|\mu| \leqq 1$ and $Q_{0}\left(\eta^{0^{\prime}}+\zeta^{0^{\prime}}\right) \neq 0$. Thus $Q_{0}\left(\eta^{0^{\prime}}\right.$ $\left.+\mu \zeta^{0^{\prime}}\right) \not \equiv 0$ in $\mu$. $Q_{0}\left(\eta^{0^{\prime}}+\mu \zeta^{0^{\prime}}\right)$ is holomorphic in $\mu,|\mu| \leqq 1$, and vanishes at $\mu=0$. Therefore there exist $\varepsilon(>0), \delta(1 \geqq \delta>0)$ such that

$$
\left|Q_{0}\left(\eta^{0^{\prime}}+\mu \zeta^{0^{\prime}}\right)\right|>2 \varepsilon \quad \text { for } \quad|\mu|=\delta .
$$

On the other hand, it follows from Lemma 2.6 that

$$
\left|v^{h_{1}} R\left(v^{-1} \xi^{0^{\prime}}+\eta^{0^{\prime}}+\mu \zeta^{0^{\prime}}\right)-Q_{0}\left(\eta^{0^{\prime}}+\mu \zeta^{0^{\prime}}\right)\right|<\varepsilon \quad \text { for } 0<v<\tilde{\delta} \text { and }|\mu|=\delta .
$$

Rouchés theorem implies that $v^{h_{1}} R\left(v^{-1} \xi^{0^{\prime}}+\eta^{0^{\prime}}+\mu \zeta^{0^{\prime}}\right)$ has zeros within
$|\mu|<\delta$, which is a contradiction to $R\left(\xi^{\prime}\right) \neq 0$ for $\xi^{\prime} \in \Xi^{n-1}-i \gamma_{1} \vartheta^{\prime}-i \dot{\Sigma}$.
Q.E.D.

Now let us define the principal part of $Q_{0}\left(\eta^{\prime}\right)$. Let $K$ be a compact set in $\Xi^{n-1}-i \gamma_{0} 9^{\prime}-i \dot{\Gamma}_{\xi^{0}}$. Then there exists $T_{K}>0$ such that

$$
\begin{equation*}
Q_{0}\left(t \eta^{\prime}\right)=t^{k_{0}} \sum_{j=0}^{\infty} Q_{0}^{j}\left(\eta^{\prime}\right) t^{-j / L}, \quad Q_{0}^{0}\left(\eta^{\prime}\right) \not \equiv 0 \tag{3.2}
\end{equation*}
$$

whose convergence is uniform in $K \times\left\{t>T_{K}\right\}$. It is easy to see that the $Q_{0}^{j}\left(\eta^{\prime}\right)$ are positively homogeneous and equal to $\sum_{\text {finite sum }}$ (polynomial of $\left.\eta^{\prime}\right) \times \prod_{k=1}^{r_{1}} c_{1 j_{k}}^{0}\left(\eta^{\prime}\right)^{-q_{j_{k}}}$, where

$$
\begin{equation*}
c_{1 j_{k}}^{0}\left(\eta^{\prime}\right)=\left\{\text { const. } p_{j_{k}\left(\xi^{0}, \mu_{j_{k}}\right)}^{0}(\eta)\right\}^{1 / l_{j_{k}}} . \tag{3.3}
\end{equation*}
$$

We can prove the following lemma in the same way as in Lemma 3.1.
Lemma 3.2. $\quad Q_{0}^{0}\left(\eta^{\prime}\right) \neq 0$ for $\eta^{\prime} \in \Xi^{n-1}-i \dot{\Sigma}$.

Define

$$
\begin{gather*}
\dot{\sigma}_{0}\left(\eta^{\prime \prime \prime}\right)=\left\{\begin{array}{lll}
\sup _{\eta^{\prime} \in \dot{\Gamma}_{\xi^{0}}}, \eta_{1} & \text { if } & Q_{0}^{0}\left(-i \eta^{\prime}\right) \neq 0 \text { for } \eta^{\prime} \in \dot{\Gamma}_{\xi^{0}}, \\
\sup _{\substack{Q_{0^{0}}^{\left(-i \eta^{\prime}\right)=0} \\
\eta^{\prime} \in \dot{\Gamma}_{\xi^{\prime}}}} \eta_{1} & \text { otherwise },
\end{array}\right.  \tag{3.4}\\
\dot{\Sigma}_{\xi^{0}}=\left\{\eta^{\prime} \in \Xi^{n-1} ; \eta_{1}>\dot{\sigma}_{0}\left(\eta^{\prime \prime \prime}\right)\right\} . \tag{3.5}
\end{gather*}
$$

Then it follows that $\dot{\Gamma}_{\xi^{0}} \supset \dot{\Sigma}_{\xi^{0}} \supset \dot{\Sigma}$.

## Lemma 3.3.

$$
\begin{array}{lll}
Q_{0}\left(\eta^{\prime}\right) \neq 0 & \text { for } & \eta^{\prime} \in \Xi^{n-1}-i \gamma_{1} \vartheta^{\prime}-i \dot{\Sigma}_{\xi^{0}}, \\
Q_{0}^{0}\left(\eta^{\prime}\right) \neq 0 & \text { for } & \eta^{\prime} \in \Xi^{n-1}-i \dot{\Sigma}_{\xi^{0}} . \tag{3.7}
\end{array}
$$

Proof. It is easily shown that

$$
Q_{0}^{0}\left(\lambda \eta^{\prime}\right)=\lambda^{k_{0}} Q_{0}^{0}\left(\eta^{\prime}\right) \quad \text { for } \quad \eta^{\prime}, \lambda \eta^{\prime} \in \Xi^{n-1}-i \dot{\Gamma}_{\xi^{0^{\prime}}},
$$

where $\lambda^{k_{0}}$ denotes the branch satisfying $1^{k_{0}}=1$ if $k_{0}$ is not an integer. Thus, modifying the proof of Lemma 2.2 in [6], one may prove the above lemma.

We can also prove the following lemma by Seidenberg's lemma.
Lemma 3.4. For any compact set $K$ in $\gamma_{1} \vartheta^{\prime}+\dot{\Sigma}_{\xi^{0}}$, there exist positive constants $a_{K}$ and $c_{K}$ such that

$$
\begin{equation*}
\left|Q_{0}\left(\eta^{\prime}\right)\right| \geqq c_{K}\left(1+\left|\eta^{\prime}\right|\right)^{-a_{K}} \quad \text { for } \quad \eta^{\prime} \in \Xi^{n-1}-i \Lambda_{K} . \tag{3.8}
\end{equation*}
$$

Next let us consider the localization of $P_{+}\left(\xi^{\prime}, \lambda\right)$ at $\left(\xi^{0^{\prime}}, \mu^{0}\right)$, where $\xi^{0^{\prime}} \in \Xi^{n-1} \backslash\{0\}$ and $\mu_{0}$ is real. We can assume without loss of generality that the roots with positive imaginary part of $P\left(\xi^{\prime}, \lambda\right)=0$ is enumerated as follows:

$$
\begin{gather*}
\lambda_{k}^{+}\left(t \xi^{0^{\prime}}+\eta^{\prime}\right)=t \mu^{0}+c_{k}\left(\eta^{\prime}\right)+0\left(t^{-1}\right), \quad 1 \leqq k \leqq r_{0},  \tag{3.9}\\
\lambda_{k}^{+}\left(t \xi^{0^{\prime}}+\eta^{\prime}\right)=t \mu_{k}^{+}\left(\xi^{0 \prime}\right)+t^{1-1 / l_{k}} c_{k}\left(\eta^{\prime}\right)^{3)}+0\left(t^{1-1 / l_{k}}\right),  \tag{3.10}\\
r_{0}+1 \leqq k \leqq r_{0}+r_{1}, \\
\lambda_{k}^{+}\left(t \xi^{0^{\prime}}+\eta^{\prime}\right)-t \mu^{0}=0\left(t^{q_{k}}\right), \quad r_{0}+1 \leqq k<l, \tag{3.11}
\end{gather*}
$$

where $\eta^{\prime} \in \Xi^{n-1}-i \gamma_{0} \vartheta^{\prime}-i \Gamma_{0}$ and $t$ is large enough, $\mu_{k}^{+}\left(\xi^{0^{\prime}}\right), r_{0}+1 \leqq k \leqq r_{0}$ $+r_{1}$, are real and the $q_{k}$ are positive rational numbers. The above enumeration implies that $\mu_{k}^{+}\left(\xi^{0^{\prime}}\right)=\mu^{0}, 1 \leqq k \leqq r_{0}$, are real simple roots of $p_{j}^{0}\left(\xi^{0^{\prime}}, \mu\right)=0$ and that $\mu_{k}^{+}\left(\xi^{0^{\prime}}\right), r_{0}+1 \leqq k \leqq r_{0}+r_{1}$, are real multiple roots with multiplicity $l_{k}$ of $p_{j}^{0}\left(\xi^{0}, \mu\right)=0$. Then we have the following

Lemma 3.5. Let $K$ be a compact set in $\left(\Xi^{n-1}-i \gamma_{0} \vartheta^{\prime}-i \dot{\Gamma}_{\xi^{0}}\right) \times \Xi$. For any non-negative integer $N$ there exists $T>0$ such that
(3.12) $t^{-h_{2}} P_{+}\left(t \xi^{0^{\prime}}+\eta^{\prime}, t \mu^{0}+\lambda\right)=\prod_{j=1}^{r_{0}}\left(\lambda-c_{j}\left(\eta^{\prime}\right)\right) S\left(\eta^{\prime}\right)$

$$
+\sum_{k=1}^{N} P_{+k}\left(\eta^{\prime}, \lambda\right) t^{-k / L}+0\left(t^{-(N+1) / L}\right) \quad \text { for } \quad\left(\eta^{\prime}, \lambda\right) \in K \text { and } t>T
$$

where $h_{2}=l-r_{0}-\sum_{j=r_{0}+1}^{r_{0}+r_{2}} 1 / l_{j}$,

$$
\begin{equation*}
S\left(\eta^{\prime}\right)=\prod_{j=r_{0}+1}^{r_{0}^{+}+r_{2}}\left\{-c_{j}\left(\eta^{\prime}\right)\right\} \prod_{j=r_{0}+r_{2}+1}^{l}\left(\mu^{0}-\mu_{j}^{+}\left(\xi^{0^{\prime}}\right)\right) \tag{3.13}
\end{equation*}
$$

and the $P_{+k}\left(\eta^{\prime}, \lambda\right)$ are polynomials of $\lambda$ whose coefficients are equal to $\sum_{\text {finite sum }}$ (polynomial of $\left.\eta^{\prime}\right) \times \prod_{j=r_{0}+1}^{r_{0}+r_{1}} c_{j}\left(\eta^{\prime}\right)^{p_{j}}$. Here we have assumed
3) $\left\{c_{k}\left(\eta^{\prime}\right)\right\}_{r_{0}+1 \leq k \leq r_{0}+r_{1}}$ is equal to $\left\{c_{1 j_{k}}\left(\eta^{\prime}\right)\right\}_{1 \leqq k \leqslant r_{1}}$ defined by (2.26).
that $\mu_{k}^{+}\left(\xi^{0^{\prime}}\right)=\mu^{0}$ for $1 \leqq k \leqq r_{0}+r_{2}$ and that $\mu_{k}^{+}\left(\xi^{0^{\prime}}\right) \neq \mu^{0}$ for $r_{0}+r_{2}$ $+1 \leqq k \leqq l$.

Proof. From Lemma 2.5 we have

$$
t \mu^{0}+\lambda-\lambda_{k}^{+}\left(t \xi^{0 \prime}+\eta^{\prime}\right)=\lambda-c_{k}\left(\eta^{\prime}\right)-\sum_{j=1}^{\infty} c_{k j}\left(\eta^{\prime}\right) t^{-j}, \quad 1 \leqq k \leqq r_{0}
$$

where $c_{k}\left(\eta^{\prime}\right)$ and the $c_{k j}\left(\eta^{\prime}\right)$ are polynomials of $\eta^{\prime}$, and

$$
\begin{aligned}
& t \mu^{0}+\lambda-\lambda_{k}^{+}\left(t \xi^{0^{\prime}}+\eta^{\prime}\right)=t\left(\mu^{0}-\mu_{k}^{+}\left(\xi^{0^{\prime}}\right)\right)+t^{1-1 / l_{k}} c_{k}\left(\eta^{\prime}\right) \\
& \quad+\lambda-\sum_{j=2}^{\infty} c_{k j}\left(\eta^{\prime}\right) t^{1-j / l_{k}}, \quad r_{0}+1 \leqq k \leqq r_{0}+r_{1},
\end{aligned}
$$

where the $c_{k j}\left(\eta^{\prime}\right)$ are equal to (polynomial of $\left.\eta^{\prime}\right) \times c_{k}\left(\eta^{\prime}\right)^{-n_{k j}}$. Further we have

$$
\begin{aligned}
& t^{-l+r_{0}+r_{1}} \prod_{k=r_{0}+r_{1}+1}^{l}\left(t \mu^{0}+\lambda-\lambda_{k}^{+}\left(t \xi^{0^{\prime}}+\eta^{\prime}\right)\right) \\
& \quad=\prod_{k=r_{0}+r_{1}+1}^{l}\left(\mu^{0}-\mu_{k}^{+}\left(\xi^{0}\right)\right)+\sum_{j=1}^{\infty} q_{j}\left(\eta^{\prime}, \lambda\right) t^{-j},
\end{aligned}
$$

where the $q_{j}\left(\eta^{\prime}, \lambda\right)$ are polynomials of $\eta^{\prime}$ and $\lambda$. This completes the proof.
Q.E.D.

Let $\left\{s_{k}\right\}_{1 \leqq k \leqq r_{0}}$ denote the set of suffixes such that $\mu_{k}^{+}\left(\xi^{\prime}\right)$ are simple roots of $p_{s_{k}}^{0}\left(\xi^{\prime}, \mu\right)=0$ for $\left|\xi^{\prime}-\xi^{0^{\prime}}\right|<\varepsilon$ and $\mu_{k}^{+}\left(\xi^{0^{\prime}}\right)=\mu^{0}$.

Lemma 3.6. For $1 \leqq k \leqq r_{0}$

$$
\begin{equation*}
c_{k}\left(\eta^{\prime}\right)=\operatorname{grad} \mu_{k}^{+}\left(\xi^{0^{\prime}}\right) \cdot \eta^{\prime}+\alpha_{k}\left(\xi^{0^{\prime}}\right), \tag{3.14}
\end{equation*}
$$

where

$$
\begin{align*}
\alpha_{k}\left(\xi^{0^{\prime}}\right)= & (2 \pi i)^{-1} \int_{\left|z-\mu_{k}^{+}\left(\xi^{0^{\prime}}\right)\right|=\delta} z\left\{p_{s_{k}}^{0}\left(\xi^{0^{\prime}}, z\right) \frac{\partial p_{s_{k}}^{1}}{\partial z}\left(\xi^{0^{\prime}}, z\right)\right.  \tag{3.15}\\
& \left.-\frac{\partial p_{s_{k}}^{0}}{\partial z}\left(\xi^{0^{\prime}}, z\right) p_{s_{k}}^{1}\left(\xi^{0^{\prime}}, z\right)\right\} / p_{s_{k}}^{0}\left(\xi^{0^{\prime}}, z\right)^{2} d z
\end{align*}
$$

Moreover, for $1 \leqq k \leqq r_{0}$

$$
\begin{equation*}
\lambda-\operatorname{grad} \mu_{k}^{+}\left(\xi^{0^{\prime}}\right) \cdot \eta^{\prime}-\alpha_{k}\left(\xi^{0^{\prime}}\right)=\text { const. } p_{s_{k}\left(\xi^{0}, \mu^{0}\right)}\left(\eta^{\prime}, \lambda\right) . \tag{3.16}
\end{equation*}
$$

## Remark.

$$
\begin{equation*}
P_{+\left(\xi^{0}, \mu^{0}\right)}\left(\eta^{\prime}, \lambda\right)=\prod_{j=1}^{r_{0}} \text { const. } p_{s_{J}\left(\xi^{0}, \mu^{0}\right)}\left(\eta^{\prime}, \lambda\right) S\left(\eta^{\prime}\right) . \tag{3.17}
\end{equation*}
$$

Proof. Since $\mu_{k}^{+}\left(\xi^{0^{\prime}}\right)=\mu^{0}$ is a real simple root of $p_{s_{k}}^{0}\left(\xi^{0^{\prime}}, \mu\right)=0$, $\lambda_{k}^{+}\left(t \xi^{0^{\prime}}+\eta^{\prime}\right)$ is a simple root of $p_{s_{k}}\left(t \xi^{0^{\prime}}+\eta^{\prime}, \lambda\right)=0$ for $t$ large enough. Thus we have

$$
\begin{aligned}
& \lambda_{k}^{+}\left(t \xi^{0^{\prime}}+\eta^{\prime}\right)-t \mu_{k}^{+}\left(\xi^{0^{\prime}}\right)=(2 \pi i)^{-1} \int_{\left|z-\mu_{k}^{+}\left(\xi^{0}\right)\right|=\delta} z \\
& \quad \times\left[p_{s_{k}}^{0}\left(\xi^{0^{\prime}}, z\right)\left\{\sum_{j=1}^{n-1} \frac{\partial^{2} p_{s_{k}}^{0}}{\partial \xi_{j} \partial z}\left(\xi^{0^{\prime}}, z\right) \eta_{j}+\frac{\partial p_{s_{k}}^{1}}{\partial z}\left(\xi^{0^{\prime}}, z\right)\right\}\right. \\
& \left.\quad-\frac{\partial p_{s_{k}}^{0}}{\partial z}\left(\xi^{0^{\prime}}, z\right)\left\{\sum_{j=1}^{n-1} \frac{\partial p_{s_{k}}^{0}}{\partial \xi_{j}}\left(\xi^{0^{\prime}}, z\right) \eta_{j}+p_{s_{k}}^{1}\left(\xi^{0^{\prime}}, z\right)\right\}\right] \\
& \quad \times p_{s_{k}}^{0}\left(\xi^{0^{\prime}}, z\right)^{-2} d z+0\left(t^{-1}\right) .
\end{aligned}
$$

This implies (3.14). (3.16) is obvious.
Q.E.D.

## §4. Proof of Theorem $\mathbb{1} \mathbb{1}$

From the results in $\S 3$ we have the following
Lemma 4.1. Let $\tilde{K}$ be a compact set in $\left(\Xi^{n}-i s \vartheta\right) \times \Xi$, where $s$ is sufficiently large. Then for any non-negative integer $N$ there exists $T>0$ such that

$$
\begin{align*}
\sum_{j, k=1}^{l} & \frac{R_{j k}\left(t \xi^{0^{\prime}}+\eta^{\prime}\right) B_{k}\left(t \xi^{0}+\eta\right)\left(t \mu^{0}+\lambda\right)^{j-1}}{R\left(t \xi^{0^{\prime}}+\eta^{\prime}\right) P_{+}\left(t \xi^{0^{\prime}}+\eta^{\prime}, t \mu^{0}+\lambda\right) P\left(t \xi^{0}+\eta\right)}  \tag{4.1}\\
& =t^{-p_{0}} \sum_{j=0}^{N} \widetilde{F}_{j}(\eta, \lambda) t^{-j / L}+0\left(t^{-(N+1) / L}\right)
\end{align*}
$$

for $(\eta, \lambda)$ in $\tilde{K}$ and $t>T$, where the $\tilde{F}_{j}(\eta, \lambda)$ are equal to $\sum_{\text {finite sum }}$ (polynomial of $\quad(\eta, \lambda)) \times Q_{0}\left(\eta^{\prime}\right)^{-n_{1}} \prod_{j=1}^{r_{0}^{0}} p_{s_{s}\left(\xi^{0}, \mu^{0}\right)}\left(\eta^{\prime}, \lambda\right)^{-n_{2}} \times P_{\xi^{0}}(\eta)^{-n_{3}} \Pi_{k=1}^{r_{1}}$ $\left\{p_{j_{k}\left(\xi^{0}, \mu_{j_{k}}\right)}(\eta)\right\}^{\left.n_{4 k} / l l_{j_{k}}, 4\right)}, p_{0}$ is a rational number, $n_{1}, n_{2}$ and $n_{3}$ are positive integers and the $n_{4 k}$ are integers.
4) The $j_{k}$ and $l_{j_{k}}$ have been defined in $\S 2$.

Proof. The localizations $Q_{0}\left(\eta^{\prime}\right), p_{s_{\mathrm{J}}\left(\xi^{\circ}, \mu^{\mathrm{o}}\right)\left(\eta^{\prime}, \lambda\right),} P_{\xi^{\mathrm{o}}(\eta)}$ and $p_{j_{k}\left(\xi^{\mathrm{o}}\right.}$, $\mu_{J_{k}}(\eta)$ do not vanish for $(\eta, \lambda)$ in $\left(\Xi^{n}-i s \vartheta\right) \times \Xi$. From Lemmas 2.5, 2.6, 3.5 and 3.6 the asscrtions of Lemma 4.1 follows.
Q.E.D.

By Seidenberg's lemma we have the following
Lemma 4.2. For any positive integer $N$ there exist positive constants $a$ and $c$ such that

$$
\begin{align*}
& \left\lvert\, t^{p_{0}+N / L}\left\{\sum_{j, k=1}^{l} \frac{R_{j k}\left(t \xi^{0^{\prime}}+\eta^{\prime}\right) B_{k}\left(t \xi^{0}+\eta\right)\left(t \mu^{0}+\lambda\right)^{j-1}}{R\left(t \xi^{0^{\prime}}+\eta^{\prime}\right) P_{+}\left(t \xi^{0^{\prime}}+\eta^{\prime}, t \mu^{0}+\lambda\right) P\left(t \xi^{0}+\eta\right)}\right.\right.  \tag{4.2}\\
& \left.\quad-\sum_{j=0}^{N=1} \widetilde{F}_{j}(\eta, \lambda) t^{-j / L}\right\} \mid \leqq a(1+|\eta|+|\lambda|)^{c}
\end{align*}
$$

for $(\eta, \lambda) \in\left(\Xi^{n}-i s \vartheta\right) \times \Xi$ and $t \geqq 1$, where $s$ is large enough.
Remark. We can also prove the above lemma, making use of (2.21) without Seidenberg's lemma.

Put

$$
\begin{align*}
& \tilde{\Gamma}_{\left(\xi^{0}, \mu^{0}\right)}=\cap_{k=1}^{r_{0}^{0}}\left\{(\eta, \lambda) \in \Xi^{n+1} ;\left(\eta^{\prime}, \lambda\right) \in \Gamma\left(p_{s_{k}\left(\xi^{0}, \mu^{0}\right)}, \vartheta\right)\right\},  \tag{4.3}\\
& \Gamma_{\xi^{0}, \mu^{0}}=\left(\Gamma\left(P_{\xi^{0}}, \vartheta\right) \times \Xi\right) \cap \tilde{\Gamma}_{\left(\xi^{0}, \mu^{0}\right)} \cap\left(\dot{\Sigma}_{\varsigma^{0}} \times \Xi^{2}\right) . \tag{4.4}
\end{align*}
$$

Lemma 4.3. Let $\tilde{K}$ be a compact set in $\gamma_{1}(\vartheta, 0)+\Gamma_{\xi^{0}, \iota^{0}}$. Then there exist positive constants $a_{j \widetilde{K}}$ and $c_{j \widetilde{K}}$ such that

$$
\begin{equation*}
\left|\widetilde{F}_{j}(\eta, \lambda)\right| \leqq a_{j \widetilde{K}}(1+|\eta|+|\lambda|)^{c_{J} \widetilde{K}} \quad \text { for } \quad(\eta, \lambda) \in \Xi^{n+1}-i \Lambda_{\bar{K}}, \tag{4.5}
\end{equation*}
$$

where $\Lambda_{\bar{K}}=\{t(\eta, \lambda) ;(\eta, \lambda) \in \widetilde{K}, t \geqq 1\}$.
Now we can prove Theorem 1.1. In fact, we have

$$
\begin{align*}
& \exp \left[-i t\left\{\left(x^{\prime}-y^{\prime}\right) \cdot \xi^{0^{\prime}}+x_{n} \mu^{0}-y_{n} \xi_{n}^{0}\right\}\right] F(x, y)  \tag{4.6}\\
& =(2 \pi)^{-(n+1)} \int_{\Xi^{n+1}} i^{-1} \sum_{j, k=1}^{l} \exp \left[i \left\{\left(x^{\prime}-y^{\prime}\right) \cdot\left(\zeta^{\prime}+i \eta^{\prime}\right)+\lambda x_{n}\right.\right. \\
& \left.\left.\quad-y_{n}\left(\zeta_{n}+i \eta_{n}\right)\right\}\right] \\
& \quad \times \frac{R_{j k}\left(t \xi^{0^{\prime}}+\zeta^{\prime}+i \eta^{\prime}\right) B_{k}\left(t \xi^{0}+\zeta+i \eta\right)\left(t \mu^{0}+\lambda\right)^{j-1}}{R\left(t \xi^{0^{\prime}}+\zeta^{\prime}+i \eta^{\prime}\right) P_{+}\left(t \xi^{0^{\prime}}+\zeta^{\prime}+i \eta^{\prime}, t \mu^{0}+\lambda\right) P\left(t \xi^{0}+\zeta+i \eta\right)} d \zeta d \lambda,
\end{align*}
$$

where $\eta=-s \vartheta$ and $s$ is sufficiently large. From Lemmas 4.1 and 4.2 and (4.6) (1.13) easily follows, putting

$$
\begin{align*}
F_{j}(x, y)= & (2 \pi)^{-(n+1)} \int_{\Xi^{n+1}} i^{-1} \exp \left[i \left\{\left(x^{\prime}-y^{\prime}\right) \cdot\left(\zeta^{\prime}+i \eta^{\prime}\right)\right.\right.  \tag{4.7}\\
& \left.\left.+\lambda x_{n}-y_{n}\left(\zeta_{n}+i \eta_{n}\right)\right\}\right] \widetilde{F}_{j}(\zeta+i \eta, \lambda) d \zeta d \lambda .
\end{align*}
$$

(1.15) follows from the Riemann-Lebesgue theorem. From Lemma 4.3 we have (1.16), applying the Paley-Wiener theorem to (4.7). This completes the proof of Theorem 1.1.

The following theorem shows that the localization of $\widetilde{R}_{0}\left(\xi^{\prime}\right)$ at $\xi^{0 \prime}$ coincides with $Q_{0}^{0}\left(\eta^{\prime}\right)$ under some assumptions.

Theorem 4.1. Assume that each $p_{j}^{0}\left(\xi^{0}, \mu\right)=0$ has no real multiple roots. Then the localization $Q_{0}\left(\eta^{\prime}\right)$ of $R\left(\xi^{\prime}\right)$ at $\xi^{0^{\prime}}$ is a hyperbolic polynomial and $\dot{\Sigma}_{\xi^{0}}=\Gamma\left(Q_{0}\left(\eta^{\prime}\right), \vartheta^{\prime}\right)$. Moreover $Q_{0}^{0}\left(\eta^{\prime}\right)$ is equal to the localization of $\widetilde{R}_{0}\left(\xi^{\prime}\right)$ at $\xi^{0^{\prime}}$, if at least one of the following conditions is satisfied: (i) The system $\left\{P(-D), B_{j}(-D)\right\}$ satisfies the Lopatinski condition. (ii) $\xi^{0} \in \partial \dot{\Sigma}$.

Proof. The first assertion is obvious. Since the real roots of $p_{j}^{0}\left(\xi^{0}\right.$, $\mu)=0,1 \leqq j \leqq q$, are simple, $R\left(t \xi^{\prime}\right)$ can be continued analytically to a neighborhood of $\xi^{0^{\prime}}$ when $t>T$. Moreover the $\tilde{R}_{j}\left(\xi^{\prime}\right)$ are holomorphic in the above neighborhood. If $\widetilde{R}_{0}\left(\xi^{0^{\prime}}\right)$ does not vanish, then it follows that the localization $Q_{0}\left(\eta^{\prime}\right)$ of $R\left(\xi^{\prime}\right)$ at $\xi^{0^{\prime}}$ is equal to $\widetilde{R}_{0}\left(\xi^{0^{\prime}}\right)$. Thus it suffices to show that $Q_{0}^{0}\left(\eta^{\prime}\right)$ is equal to the localization of $\tilde{R}_{0}\left(\xi^{\prime}\right)$ at $\xi^{0^{\prime}}$ when $\widetilde{R}_{0}\left(\xi^{0^{\prime}}\right)=0$. Since $\widetilde{R}_{0}\left(\xi^{0^{\prime}}+v \eta^{\prime}+s \vartheta^{\prime}\right) \not \equiv 0$, applying Weierstrass, preparation theorem, we have

$$
\begin{gathered}
\widetilde{R}_{0}\left(\xi^{0 \prime}+v \eta^{\prime}+s \vartheta^{\prime}\right)=\left\{s^{l}+b_{1}^{0}\left(\xi^{0^{\prime}}+v \eta^{\prime}\right) s^{l-1}+\cdots+b_{l}^{0}\left(\xi^{0 \prime}+v \eta^{\prime}\right)\right\} \\
\times S_{0}\left(\xi^{0^{\prime}}+v \eta^{\prime} ; s\right) \quad \text { for } \quad|v|<v_{0}, \quad|s|<s_{0},
\end{gathered}
$$

where $S_{0}\left(\xi^{0^{\prime}}+\nu \eta^{\prime} ; s\right) \neq 0$ for $|v|<v_{0},|s|<s_{0}$ and $b_{j}^{0}\left(\xi^{0^{\prime}}\right)=0,1 \leqq j \leqq l$, and $\eta^{\prime}$ is fixed in $\Xi^{n-1}$. Put

$$
s^{l}+b_{1}^{0}\left(\xi^{0}+v \eta^{\prime}\right) s^{l-1}+\cdots+b_{l}^{0}\left(\xi^{0^{\prime}}+v \eta^{\prime}\right)=\prod_{k=1}^{l}\left(s+r_{k}^{0}\left(\xi^{0^{\prime}}+v \eta^{\prime}\right)\right) .
$$

Then the $r_{k}^{0}\left(\xi^{0^{\prime}}+v \eta^{\prime}\right)$ can be expanded in Puiseux series of the form

$$
r_{k}^{0}\left(\xi^{0^{\prime}}+v \eta^{\prime}\right)=\sum_{j=1}^{\infty} d_{k j}^{0}\left(\eta^{\prime}\right) v^{j / n_{k}}, \quad 1 \leqq k \leqq l .
$$

Denote by $j(k)$ a number such that $d_{k 1}^{0}=\cdots=d_{k j(k)-1}^{0}=0$ and $d_{k j(k)}^{0} \neq 0$. Then $j(k) / n_{k}$ is an integer. In fact, if $j(k) / n_{k}$ is not an integer, a branch of $r_{k}^{0}\left(\xi^{\prime \prime}+v \eta^{\prime}\right)$ has positive imaginary part for some real $v$. This contradicts the fact that

$$
\widetilde{R}_{0}\left(\xi^{0^{\prime}}+v \eta^{\prime}+s \vartheta^{\prime}\right) \neq 0 \quad \text { for } \quad \operatorname{Im} v=0 \text { and } \operatorname{Im} s<0
$$

Moreover it follows that $j(k)=n_{k}$ and $d_{k n_{k}}^{0}\left(\eta^{\prime}\right)>0$ for $\eta^{\prime} \in \dot{\Sigma}$. In fact,

$$
\widetilde{R}_{0}\left(\xi^{0^{\prime}}+v \eta^{\prime}+s \vartheta^{\prime}\right) \neq 0 \quad \text { for } \quad \operatorname{Im} v<0 \text { and } \operatorname{Im} s \leqq 0
$$

and, therefore, $\operatorname{Im} r_{k}^{0}\left(\xi^{0^{\prime}}+v \eta^{\prime}\right)<0$ for $\operatorname{Im} v<0$. Since

$$
\begin{align*}
& v^{h o} R\left(v^{-1} \xi^{0^{\prime}}+\eta^{\prime}+v^{-1} s \vartheta^{\prime}\right)=\widetilde{R}_{0}\left(\xi^{0^{\prime}}+v \eta^{\prime}+s \vartheta^{\prime}\right)  \tag{4.8}\\
& \quad+v \widetilde{R}_{1}\left(\xi^{0^{\prime}}+v \eta^{\prime}+s \vartheta^{\prime}\right)+\cdots \quad \text { for } \quad|s|<s_{0}, \quad 0<v<v_{0},
\end{align*}
$$

we have

$$
\begin{aligned}
& v^{h_{0}} R\left(v^{-1} \xi^{0^{\prime}}+\eta^{\prime}+v^{-1} s \vartheta^{\prime}\right)=\left\{s^{l}+b_{1}\left(\xi^{0^{\prime}}+v \eta^{\prime} ; v\right) s^{l-1}+\right. \\
& \left.\quad \cdots+b_{l}\left(\xi^{0^{\prime}}+v \eta^{\prime} ; v\right)\right\} S\left(\xi^{0^{\prime}}+v \eta^{\prime} ; v, s\right) \quad \text { for } \quad|s|<s_{0}, \quad 0<v<v_{0},
\end{aligned}
$$

where $S\left(\xi^{0^{\prime}}+v \eta^{\prime} ; v, s\right) \neq 0$ for $|s|<s_{0},|v|<v_{0}$ and $b_{j}\left(\xi^{0^{\prime}} ; 0\right)=0,1 \leqq j \leqq l$. Here we note that the right hand side of (4.8) can be defined for $|s|$ $<s_{0}$ and $|v|<v_{0}$. So we can define $v^{h o} R\left(v^{-1} \xi^{0 \prime}+\eta^{\prime}+v^{-1} s \vartheta^{\prime}\right)$ for $|s|<s_{0}$, $|v|<v_{0}$. Then $R\left(v^{-1} \xi^{\prime}\right)$ does not always coincide with the analytic continuation to a neighborhood of $v^{-1} \xi^{0}$ of the Lopatinski determinant for the system $\left\{P(D), B_{j}(D)\right\}$, but with the Lopatinski determinant $R^{-}\left(|v|^{-1} \xi^{\prime}\right)$ for the system $\left\{P(-D), B_{j}(-D)\right\}$ apart from a constant factor when $-v_{0}<\nu<0,\left|\xi^{\prime}-\xi^{\prime}\right|<\varepsilon$ and $\xi^{\prime} \in \Xi^{n-1}-i \gamma_{0} \vartheta^{\prime}-i \Gamma^{\circ}$. Now put

$$
s^{l}+b_{1}\left(\xi^{0^{\prime}}+v \eta^{\prime} ; v\right) s^{l-1}+\cdots+b_{l}\left(\xi^{0^{\prime}}+v \eta^{\prime} ; v\right)=\prod_{k=1}^{l}\left(s+r_{k}\left(\xi^{0^{\prime}}+v \eta^{\prime} ; v\right)\right) .
$$

Then the $r_{k}\left(\xi^{0^{\prime}}+v \eta^{\prime} ; v\right)$ can be also expanded in Puiseux series of the form

$$
r_{k}\left(\xi^{0^{\prime}}+v \eta^{\prime} ; v\right)=\sum_{j=1}^{\infty} d_{k j}\left(\eta^{\prime}\right)^{j / \tilde{n}_{k}}, \quad 1 \leqq k \leqq l .
$$

Denote by $\tilde{J}(k)$ a number such that $d_{k 1}=\cdots=d_{k \tilde{\jmath}(k)-1}=0$ and $d_{k \tilde{\jmath}(k)} \neq 0$.

Then $\tilde{\jmath}(k) / \tilde{n}_{k}=1 / 2$ or $\geqq 1$. This follows from the fact that

$$
v^{-1} \operatorname{Im} r_{k}\left(\xi^{0^{\prime}}+v \eta^{\prime} ; v\right) \leqq \gamma_{1} \quad \text { for } \quad 0<v<v_{0} .
$$

Moreover if $\tilde{\jmath}(k) / \tilde{n}_{k}=1 / 2$, it follows that $\operatorname{Im} d_{k \tilde{J}(k)}=0$.
(i) When the system $\left\{P(-D), B_{j}(-D)\right\}$ satisfies the Lopatinski condition, i.e.

$$
R^{-}\left(\xi^{\prime}\right) \neq 0 \quad \text { for } \quad \operatorname{Im} \xi_{1}<\gamma_{2}, \quad \xi^{\prime \prime \prime} \in \Xi^{n-2}
$$

it follows that $\tilde{j}(k) / \tilde{n}_{k} \geqq 1$. In fact,

$$
|v|^{-1} \operatorname{Im} r_{k}\left(\xi^{0^{\prime}}+v \eta^{\prime} ; v\right) \leqq \gamma_{2} \quad \text { for } \quad-v_{0}<v<0
$$

(ii) When $\xi^{0^{\prime}} \in \partial \dot{\Sigma}$, it follows that $\tilde{j}(k) / \tilde{n}_{k} \geqq 1$. In fact,

$$
\begin{aligned}
& R\left(v^{-1} \xi^{0^{\prime}}+\eta^{\prime}+v^{-1} s \vartheta^{\prime}\right) \neq 0 \quad \text { for } \quad 0<\operatorname{Re} v<v_{0}, \\
& \quad|\operatorname{Im} v| \leqq \delta_{0} \operatorname{Re} v \quad \text { and } \quad \operatorname{Im}\left(v^{-1} \xi^{0^{\prime}}+v^{-1} s \vartheta^{\prime}\right) \in-\gamma_{1} \vartheta^{\prime}-\dot{\Sigma},
\end{aligned}
$$

where $\delta_{0}$ is sufficiently small. Putting $v=\tilde{v}(1+i \delta)$, where $0<\tilde{v}<\nu_{0}$, we have

$$
\begin{aligned}
& \tilde{v}^{-1} \operatorname{Im}\left[(1+i \delta)^{-1} \xi^{0^{\prime}}+(1+i \delta)^{-1} r_{k}\left(\xi^{0^{\prime}}+\tilde{v}(1+i \delta) \eta^{\prime} ; \tilde{v}(1+i \delta)\right) \vartheta^{\prime}\right] \\
& \notin-\gamma_{1} \vartheta^{\prime}-\dot{\Sigma} .
\end{aligned}
$$

If $\tilde{j}(k) / \tilde{n}_{k}=1 / 2$, then it follows that

$$
\begin{gathered}
\left(1+\delta^{2}\right)^{-1} \xi^{0} \pm 1 / 2 \tilde{v}^{1 / 2} d_{k \tilde{J}(k)} 9^{\prime}+o\left(\tilde{v}^{1 / 2}\right) \notin \dot{\Sigma} \quad \text { for } \tilde{v} \text { small } \\
\text { enough and }|\delta| \geqq \tilde{v}^{1 / N},
\end{gathered}
$$

where $N$ is large enough. This implies that $d_{k \tilde{J}(k)}=0$, which is a contradiction to $d_{k \tilde{j}(k)} \neq 0$. Thus we have $\tilde{\jmath}(k) / \tilde{n}_{k} \geqq 1$. When $\tilde{J}(k) / \tilde{n}_{k} \geqq 1$, it is easy to see that the localization of $\widetilde{R}_{0}\left(\xi^{\prime}\right)$ at $\xi^{0^{\prime}}$ is the principal part $Q_{0}^{0}\left(\eta^{\prime}\right)$ of the localization $Q_{0}\left(\eta^{\prime}\right)$ of $R\left(\xi^{\prime}\right)$ at $\xi^{0^{\prime}}$.
Q.E.D.

## §5. Some examples

Let us visualize Theorem 1.1 for some simple examples. $\operatorname{supp}_{x} E_{\xi 0}(x$ $-y)$ is an incident bicharacteristic line emanated from a point $y=(0$,
$\left.y_{2}, \ldots, y_{n}\right) \in \mathbf{R}_{+}^{n} . \quad \cup_{j=0}^{\infty} \operatorname{supp}_{x} F_{j}(x, y)$ is an reflected bicharacteristic line corresponding to the above incident bicharacteristic line.

Example 5.1. Consider the following hyperbolic polynomial with respect to $\vartheta=(1,0,0)$ :

$$
\begin{equation*}
P(\xi)=\left(\xi_{1}^{2}-\xi_{2}^{2}-\xi_{3}^{2}\right)\left(\xi_{1}^{2}-\xi_{2}^{2} / 4-\xi_{3}^{2} / 4\right) . \tag{5.1}
\end{equation*}
$$

The roots of the equation $P\left(\xi^{\prime}, \lambda\right)=0$ in $\lambda$ are

$$
\begin{array}{ll}
\lambda_{1}^{ \pm}\left(\xi^{\prime}\right)=\mu_{1}^{ \pm}\left(\xi^{\prime}\right)=\operatorname{sgn}\left(\mp \xi_{1}\right) \sqrt{\xi_{1}^{2}-\xi_{2}^{2}}, & \text { when }  \tag{5.2}\\
\lambda_{2}^{ \pm}\left(\xi _ { 1 } \left|\geqq\left|\xi_{2}\right|,\right.\right. \\
\mu_{2}^{ \pm}\left(\xi^{\prime}\right)=\operatorname{sgn}\left(\mp \xi_{1}\right) \sqrt{4 \xi_{1}^{2}-\xi_{2}^{2}}, & \text { when } \\
\left|\xi_{1}\right| \geqq\left|\xi_{2}\right| / 2 .
\end{array}
$$

Assume that the Lopatinski determinant $R\left(\xi^{\prime}\right)$ for the system $\{P(D)$, $\left.B_{1}(D), B_{2}(D)\right\}$ satisfies the uniform Lopatinski condition, i.e.

$$
\begin{equation*}
R\left(\xi^{\prime}\right)=\widetilde{R}_{0}\left(\xi^{\prime}\right) \neq 0 \quad \text { for } \quad \xi^{\prime} \in\left(\Xi^{2} \backslash\{0\}\right)-i 0 \vartheta^{\prime} . \tag{5.3}
\end{equation*}
$$

For example we may put

$$
\begin{equation*}
B_{1}(\xi)=1, \quad B_{2}(\xi)=\xi_{1}+\xi_{2}+\xi_{3} . \tag{5.4}
\end{equation*}
$$

Then

$$
\begin{equation*}
R\left(\xi^{\prime}\right)=\widetilde{R}_{0}\left(\xi^{\prime}\right)=-1 . \tag{5.5}
\end{equation*}
$$

It suffices to consider the localizations of $P$ at the points $\xi^{0}$ such that $\xi_{1}^{0}=1, \xi_{3}^{0}>0 \quad$ and $\quad \xi^{0} \in \operatorname{Re} A$. When $\quad \xi_{3}^{0} \leqq 0, \operatorname{supp}_{x} E_{\xi^{0}}(x-y)$ does not intersect the boundary plane $x_{3}=0$ and, therefore, it is independent of reflection. In fact, when $\xi_{3}^{0} \leqq 0$, we have

$$
\begin{equation*}
\left(\cup_{j=0}^{\infty} \operatorname{supp}_{x} F_{j}(x, y)\right) \cap \mathbf{R}_{+}^{3}=\emptyset . \tag{5.6}
\end{equation*}
$$

For $\xi^{0}=\left(1, \xi_{2}^{0}, \mu_{1}^{-}\left(1, \xi_{2}^{0}\right)\right),\left|\xi_{2}^{0}\right|<1$, and $\mu^{0}=\mu_{1}^{+}\left(\xi^{0^{\prime}}\right)$ we obtain

$$
\begin{equation*}
\Gamma_{\xi^{0}, \mu^{0}}=\left(\Gamma\left(P_{\xi^{0}}, \vartheta\right) \times \Xi\right) \cap \tilde{\Gamma}_{\left(\xi^{0}, \mu^{0}\right)}, \tag{5.7}
\end{equation*}
$$

where

$$
\begin{gather*}
\Gamma\left(P_{\xi^{0}}, \vartheta\right)=\left\{\eta \in \Xi^{3} ; \eta_{1}-\xi_{2}^{0} \eta_{2}-\mu_{1}^{-}\left(\xi^{0^{\prime}}\right) \eta_{3}>0\right\}  \tag{5.8}\\
\tilde{\Gamma}_{\left(\xi^{0}, \mu^{0}\right)}=\left\{(\eta, \lambda) \in \Xi^{4} ; \eta_{1}-\xi_{2}^{0} \eta_{2}-\mu_{1}^{+}\left(\xi^{0}\right) \lambda>0\right\} . \tag{5.9}
\end{gather*}
$$

Thus $\cup_{j=0}^{\infty} \operatorname{supp}_{x} F_{j}(x, y)$ is included in the half-line defined by the equation

$$
\begin{align*}
& x_{1}-y_{3} / \mu_{1}^{-}\left(\xi^{0^{\prime}}\right)=-x_{2} / \xi_{2}^{0}-y_{3} / \mu_{1}^{-}\left(\xi^{0^{\prime}}\right)=-x_{3} / \mu_{1}^{+}\left(\xi^{0^{\prime}}\right)  \tag{5.10}\\
& x_{1}>0, \quad x_{3}>0 .
\end{align*}
$$

Here we have assumed that $y=\left(0,0, y_{3}\right)$. This line intersects the hyperplane $x_{3}=0$ at $\left(x_{1}, x_{2}\right)=\left(y_{3} / \mu_{1}^{-}\left(\xi^{0^{\prime}}\right),-\xi_{2}^{0} y_{3} / \mu_{1}^{-}\left(\xi^{0}\right)\right)$. $\quad \operatorname{supp}_{x} E_{\xi^{0}}(x-y)$ is included in the half-line defined by the equation

$$
\begin{equation*}
x_{1}-y_{3} / \mu_{1}^{-}\left(\xi^{0^{\prime}}\right)=-x_{2} / \xi_{2}^{0}-y_{3} / \mu_{1}^{-}\left(\xi^{0^{\prime}}\right)=-x_{3} / \mu_{1}^{-}\left(\xi^{0^{\prime}}\right), \quad x_{1}>0 \tag{5.11}
\end{equation*}
$$

This line also intersects the hyperplane $x_{3}=0$ at $\left(x_{1}, x_{2}\right)=\left(y_{3} / \mu_{1}^{-}\left(\xi^{0}\right)\right.$, $\left.-\xi_{2}^{0} y_{3} / \mu_{1}^{-}\left(\xi^{0^{\prime}}\right)\right)$. For $\left(\xi^{0}, \mu^{0}\right)=\left(1, \xi_{2}^{0}, \mu_{1}^{-}\left(1, \xi_{2}^{0}\right), \mu_{2}^{+}\left(\xi^{0^{\prime}}\right)\right),\left|\xi_{2}^{0}\right|<1$, and ( $\xi^{0}$, $\left.\mu^{0}\right)=\left(1, \xi_{2}^{0}, \mu_{2}^{-}\left(1, \xi_{2}^{0}\right), \mu_{j}^{+}\left(\xi^{0}\right)\right),\left|\xi_{2}^{0}\right|<1, j=1,2, \quad$ and $\quad\left(\xi^{0}, \mu^{0}\right)=\left(1, \xi_{2}^{0}, \mu_{2}^{-}(1\right.$, $\left.\left.\xi_{2}^{0}\right), \mu_{2}^{+}\left(\xi^{0}\right)\right), 1<\left|\xi_{2}^{0}\right|<2$, we can calculate in the same way. Next we consider the case where $\left(\xi^{0}, \mu^{0}\right)=\left(1, \pm 1, \mu_{2}^{-}(1, \pm 1), \mu_{2}^{+}(1, \pm 1)\right)$. Then

$$
\begin{equation*}
\Gamma_{\xi^{0}, \mu^{0}}=\left(\Gamma\left(P_{\xi^{0}}, \vartheta\right) \times \Xi\right) \cap \tilde{\Gamma}_{\left(\xi^{0}, \mu^{0}\right)} \cap\left(\dot{\Sigma}_{\xi^{0}} \times \Xi^{2}\right) \tag{5.12}
\end{equation*}
$$

where

$$
\begin{align*}
& \Gamma\left(P_{\xi^{0}}, \vartheta\right)=\left\{\eta \in \Xi^{3} ; \eta_{1} \mp \eta_{2} / 4-\sqrt{3} \eta_{3} / 4>0\right\}  \tag{5.13}\\
& \tilde{\Gamma}_{\left(\xi^{0}, \mu^{0}\right)}=\left\{(\eta, \lambda) \in \Xi^{4} ; \eta_{1} \mp \eta_{2} / 4+\sqrt{3} \lambda / 4>0\right\},  \tag{5.14}\\
& \dot{\Sigma}_{\xi^{0}}=\left\{\eta^{\prime} \in \Xi^{2} ; \eta_{1} \mp \eta_{2}>0\right\} . \tag{5.15}
\end{align*}
$$

Thus we obtain

$$
\begin{align*}
\cup_{j=0}^{\infty} \operatorname{supp}_{x} F_{j}(x, y) \subset\left\{x \in \mathbf{R}_{+}^{3} ; x_{1}\right. & =4\left(x_{3}+y_{3}\right) / \sqrt{3}+u,  \tag{5.16}\\
x_{2} & \left.=\mp\left(x_{3}+y_{3}\right) / \sqrt{3} \mp u, u \geqq 0\right\} .
\end{align*}
$$

This is related to the lateral waves.
Example 5.2. Next consider the following hyperbolic polynomial with respect to $\vartheta=(1,0,0)$ :

$$
\begin{equation*}
P(\xi)=\left(\xi_{1}^{2}-\xi_{2}^{2} / 4-\xi_{3}^{2}\right)\left(\xi_{1}^{2}-\xi_{2}^{2}-\xi_{3}^{2} / 4\right) . \tag{5.17}
\end{equation*}
$$

We assume that the uniform Lopatinski condition is satisfied. The complicated cases are that $\left(\xi^{0}, \mu^{0}\right)=(1, \pm 2 / \sqrt{5}, 2 / \sqrt{5},-2 / \sqrt{5})$. Then we have

$$
\begin{equation*}
\Gamma\left(P_{\xi^{0}}, \vartheta\right)=\left\{\eta \in \Xi^{3} ; \xi_{1} \mp \xi_{2} /(2 \sqrt{5})-2 \xi_{3} / \sqrt{5}>0\right. \text { and } \tag{5.18}
\end{equation*}
$$

$$
\left.\xi_{1} \mp 2 \xi_{2} / \sqrt{5}-\xi_{3} /(2 \sqrt{5})>0\right\}
$$

$$
\begin{equation*}
\tilde{\Gamma}_{\left(\xi^{0}, \mu^{0}\right)}=\left\{(\eta, \lambda) \in \Xi^{4} ; \xi_{1} \mp \xi_{2} /(2 \sqrt{5})+2 \lambda / \sqrt{5}>0 \quad\right. \text { and } \tag{5.19}
\end{equation*}
$$

$$
\left.\xi_{1} \mp 2 \xi_{2} / \sqrt{5}+\lambda /(2 \sqrt{5})>0\right\}
$$

$$
\begin{equation*}
\dot{\Sigma}_{\xi^{0}}=\Xi^{2} . \tag{5.20}
\end{equation*}
$$

Thus we obtain

$$
\begin{align*}
& \cup_{j=0}^{\infty} \operatorname{Supp}_{x} F_{j}(x, y) \subset\left\{x \in \mathbf{R}_{+}^{3} ; x_{1}=\sqrt{5} x_{3} / 2+\sqrt{5} y_{3} / 2+2 u,\right.  \tag{5.21}\\
& x_{2}=\mp\left(x_{3} / 4+y_{3} / 4+\sqrt{5} u, 0 \leqq u \leqq 3 \sqrt{5}\left(x_{3}+y_{3}\right) / 4\right\} \\
&=\left\{x \in \mathbf{R}_{+}^{3} ; x_{3}=\left(x_{1}+6 \sqrt{5} t-2 \sqrt{5} y_{3}\right) /(2 \sqrt{5}-3 \sqrt{5} \theta / 2)\right. \\
&\left.=\left(\mp x_{2}+15 t-4 y_{3}\right) /(4-15 \theta / 4), \quad 0 \leqq \theta \leqq 1, \quad 0 \leqq t \leqq y_{3} / 4\right\} .
\end{align*}
$$

Example 5.3. Put

$$
\begin{gather*}
P(\xi)=\xi_{1}^{2}-\xi_{2}^{2}-\xi_{3}^{2},  \tag{5.22}\\
B(\xi)=a \xi_{2}+\xi_{3}, \quad a>0 . \tag{5.23}
\end{gather*}
$$

Then

$$
\begin{gather*}
\lambda^{ \pm}\left(\xi^{\prime}\right)=\mu^{ \pm}\left(\xi^{\prime}\right)=\operatorname{sgn}\left(\mp \xi_{1}\right) \sqrt{\xi_{1}^{2}-\xi_{2}^{2}}, \text { when }\left|\xi_{1}\right| \geqq\left|\xi_{2}\right|,  \tag{5.24}\\
R\left(\xi^{\prime}\right)=\widetilde{R}_{0}\left(\xi^{\prime}\right)=\mu^{+}\left(\xi^{\prime}\right)+a \xi_{2} . \tag{5.25}
\end{gather*}
$$

Thus $\{P(D), B(D)\}$ is $\mathscr{E}$-well posed. We have

$$
\begin{equation*}
\widetilde{R}_{0}\left( \pm 1, \pm 1 / \sqrt{1+a^{2}}\right)=0 . \tag{5.26}
\end{equation*}
$$

The interesting cases are that $\left(\xi^{0}, \mu^{0}\right)=\left( \pm 1, \pm 1 / \sqrt{1+a^{2}}, \pm a / \sqrt{1+a^{2}}\right.$, $\left.\mp a / \sqrt{1+a^{2}}\right)$. Then

$$
\begin{equation*}
Q_{0}\left(\xi^{\prime}\right)=Q_{0}^{0}\left(\xi^{\prime}\right)=-\sqrt{1+a^{2}} \eta_{1} / a+\left(1+a^{2}\right) \eta_{2} / a \tag{5.27}
\end{equation*}
$$

Thus we have

$$
\begin{gather*}
\Gamma\left(P_{\xi^{0}}, \vartheta\right)=\left\{\eta \in \Xi^{3} ; \eta_{1}-\eta_{2} / \sqrt{1+a^{2}}-a \eta_{3} / \sqrt{1+a^{2}}>0\right\},  \tag{5.28}\\
\tilde{\Gamma}_{\left(\xi^{0}, \mu^{0}\right)}=\left\{(\eta, \lambda) \in \Xi^{4} ; \eta_{1}-\eta_{2} / \sqrt{1+a^{2}}+a \lambda / \sqrt{1+a^{2}}>0\right\},  \tag{5.29}\\
\dot{\Sigma}_{\xi^{0}}=\left\{\eta^{\prime} \in \Xi^{2} ; \eta_{1}-\sqrt{1+a^{2}} \eta_{2}>0\right\} . \tag{5.30}
\end{gather*}
$$

From Theorem 1.1 we obtain

$$
\begin{align*}
\cup_{j=0}^{\infty} \operatorname{supp}_{x} F_{j}(x, y) \subset\left\{x \in \mathbb{R}_{+}^{3} ; x_{1}\right. & =\sqrt{1+a^{2}}\left(x_{3}+y_{3}\right) / a+u,  \tag{5.31}\\
x_{2} & \left.=-\left(x_{3}+y_{3}\right) / a-\sqrt{1+a^{2}} u, u \geqq 0\right\} .
\end{align*}
$$

This is related to the boundary waves.
